

X-ray polarimetry from a stabilised balloon-borne platform

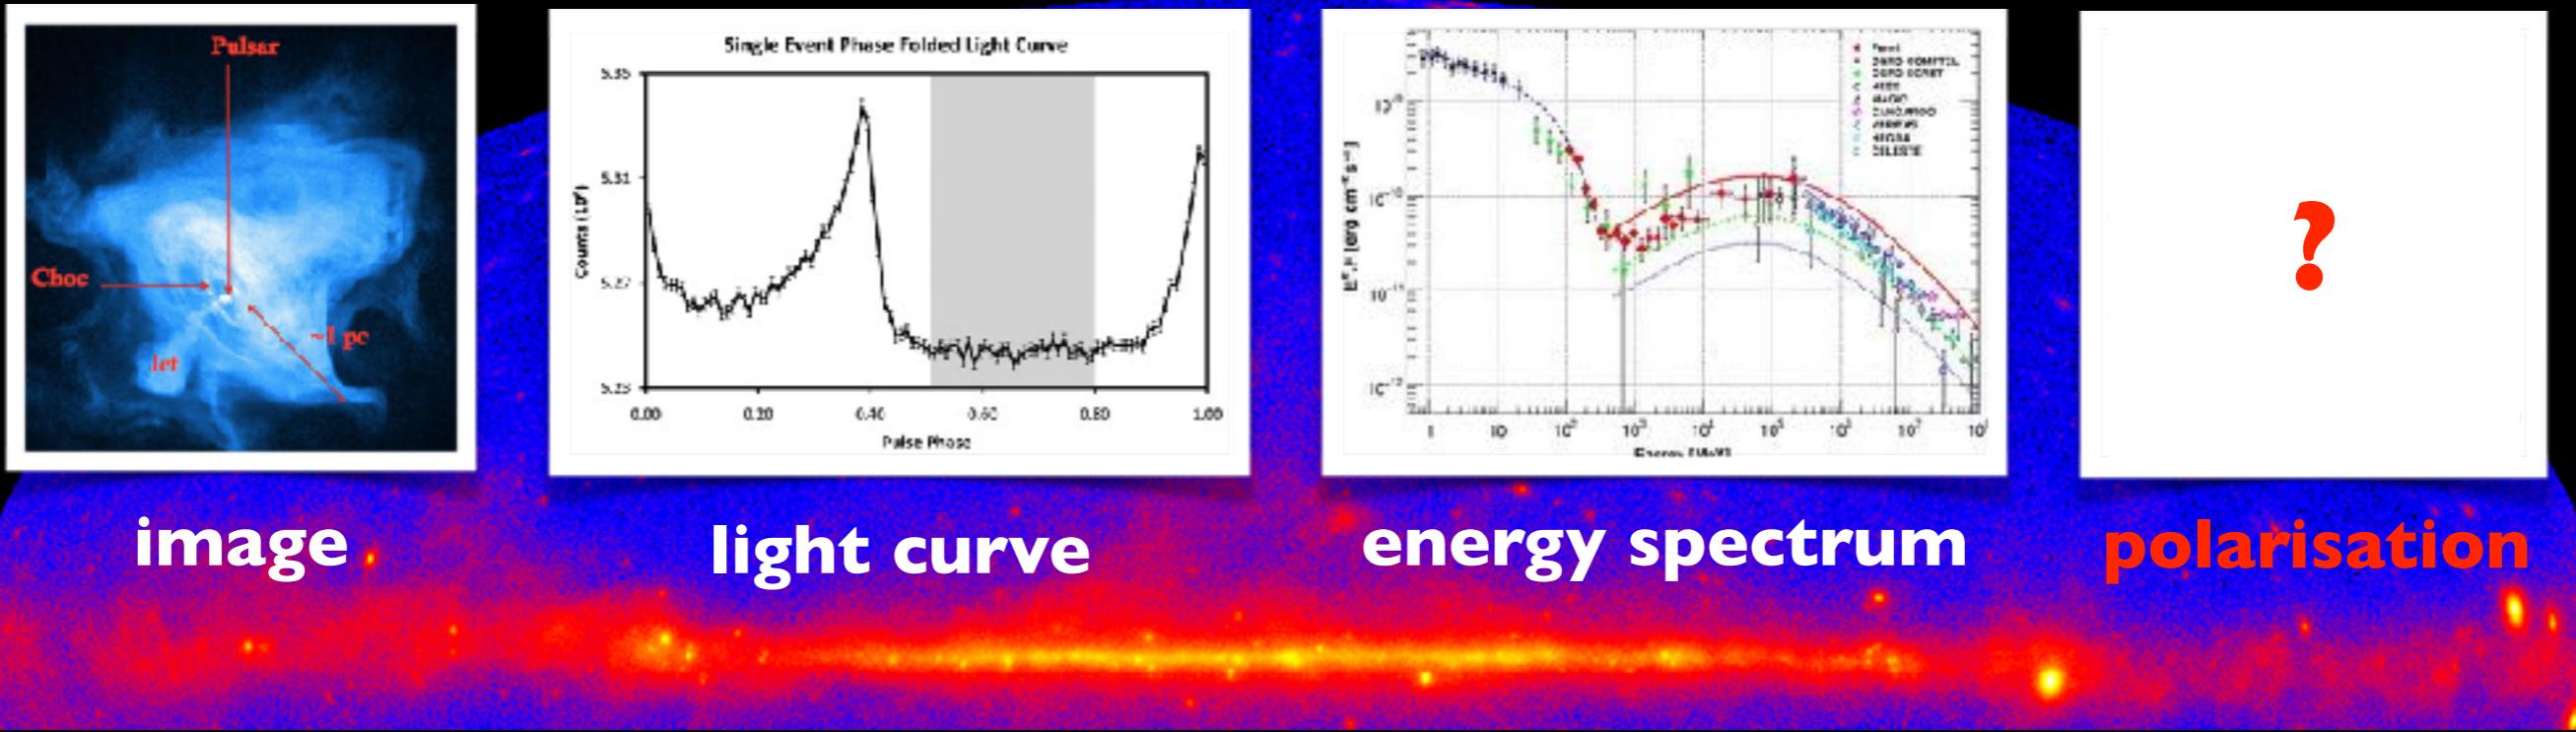

Mark Pearce

*Annual meeting of the
German Astronomical Society
Via Zoom / 2019-09-19*

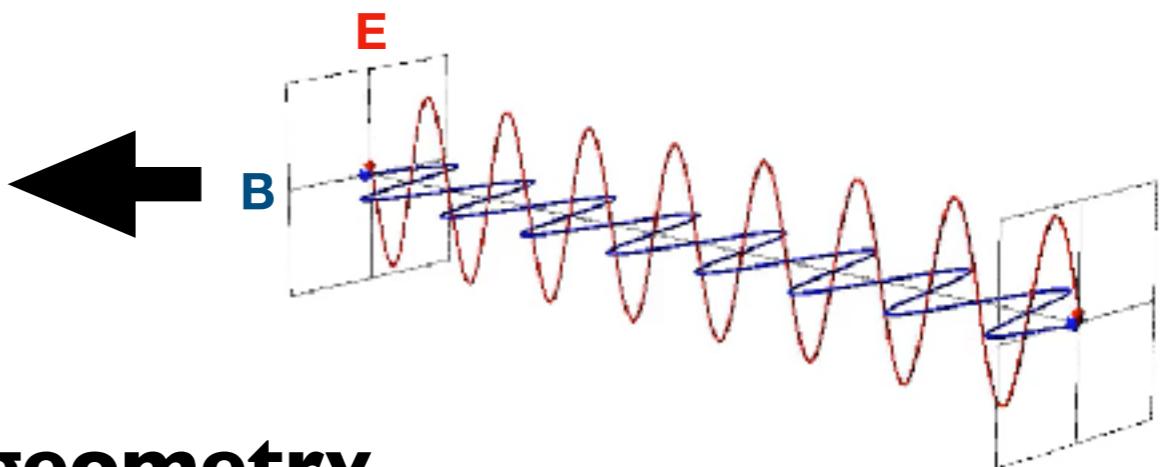

- X-ray polarimetry
(very briefly)
- “PoGO+” mission
design and performance
(my focus)
- Results achieved (very
briefly)
- What’s next?

?

- In X-ray astronomy, the **linear polarisation** of emissions (orientation of electric field vector) is not measured

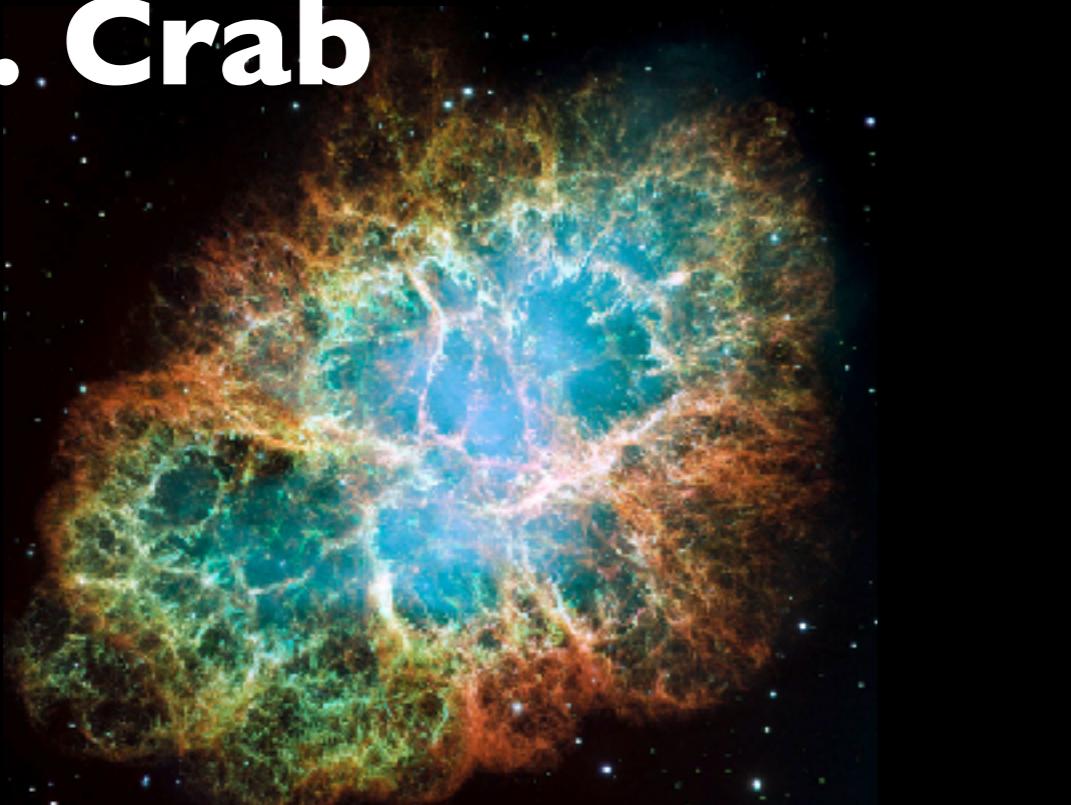

- **Polarisation Fraction (PF)** = 100%
- **Polarisation Angle (PA)** = 0°

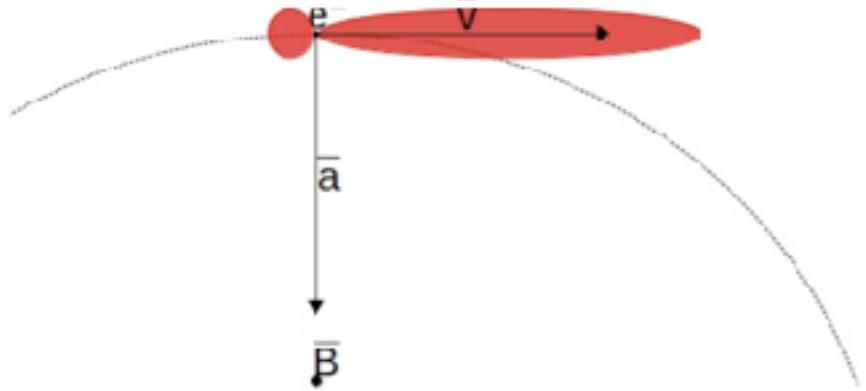

- Linear polarisation puts **constraints on geometry**

- **PF** defines the level and kind of symmetry of the system
- **PA** indicates its orientation

e.g. Crab

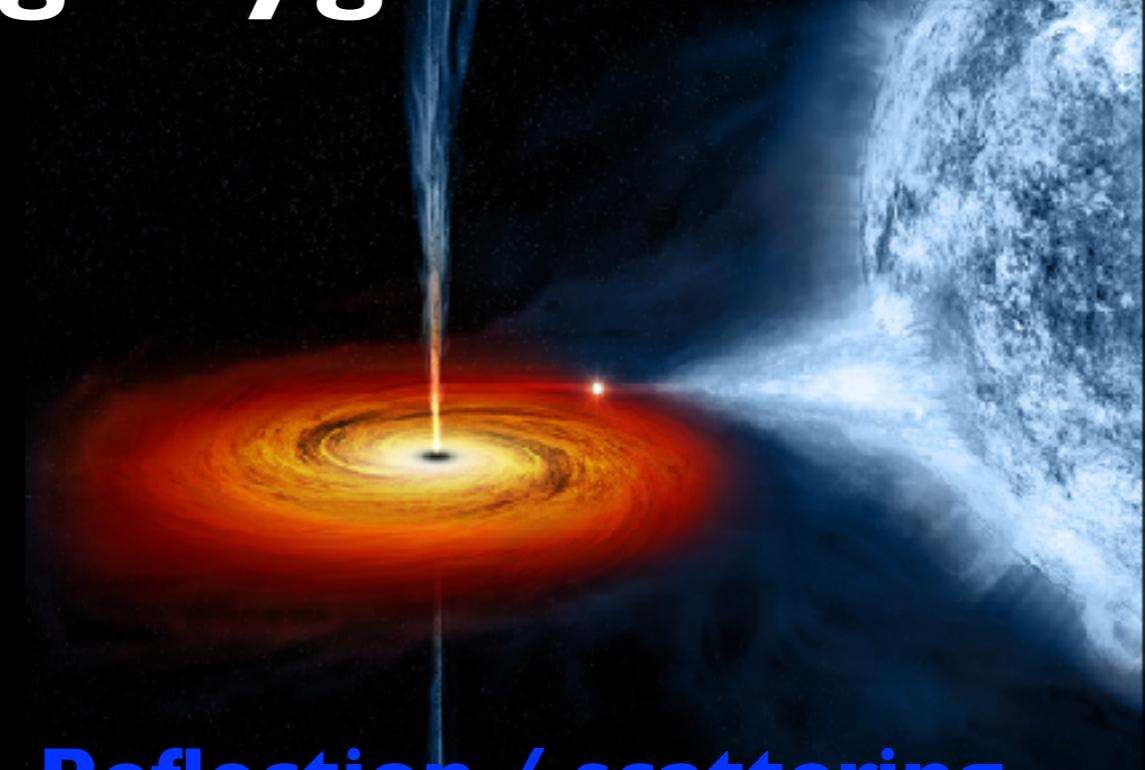

Synchrotron emission

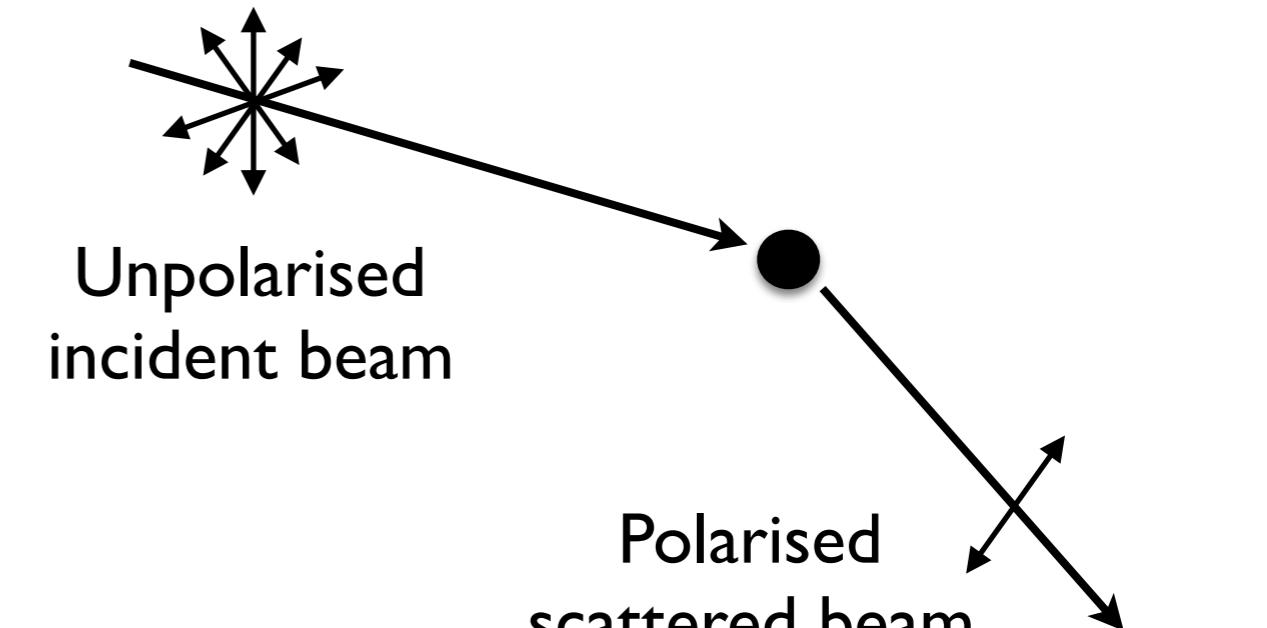

- Polarisation angle determines the magnetic field direction
- Maximum polarisation fraction for synchrotron emission $\sim 75\%$. Will be reduced for a disordered magnetic field.

e.g. Cygnus X-1

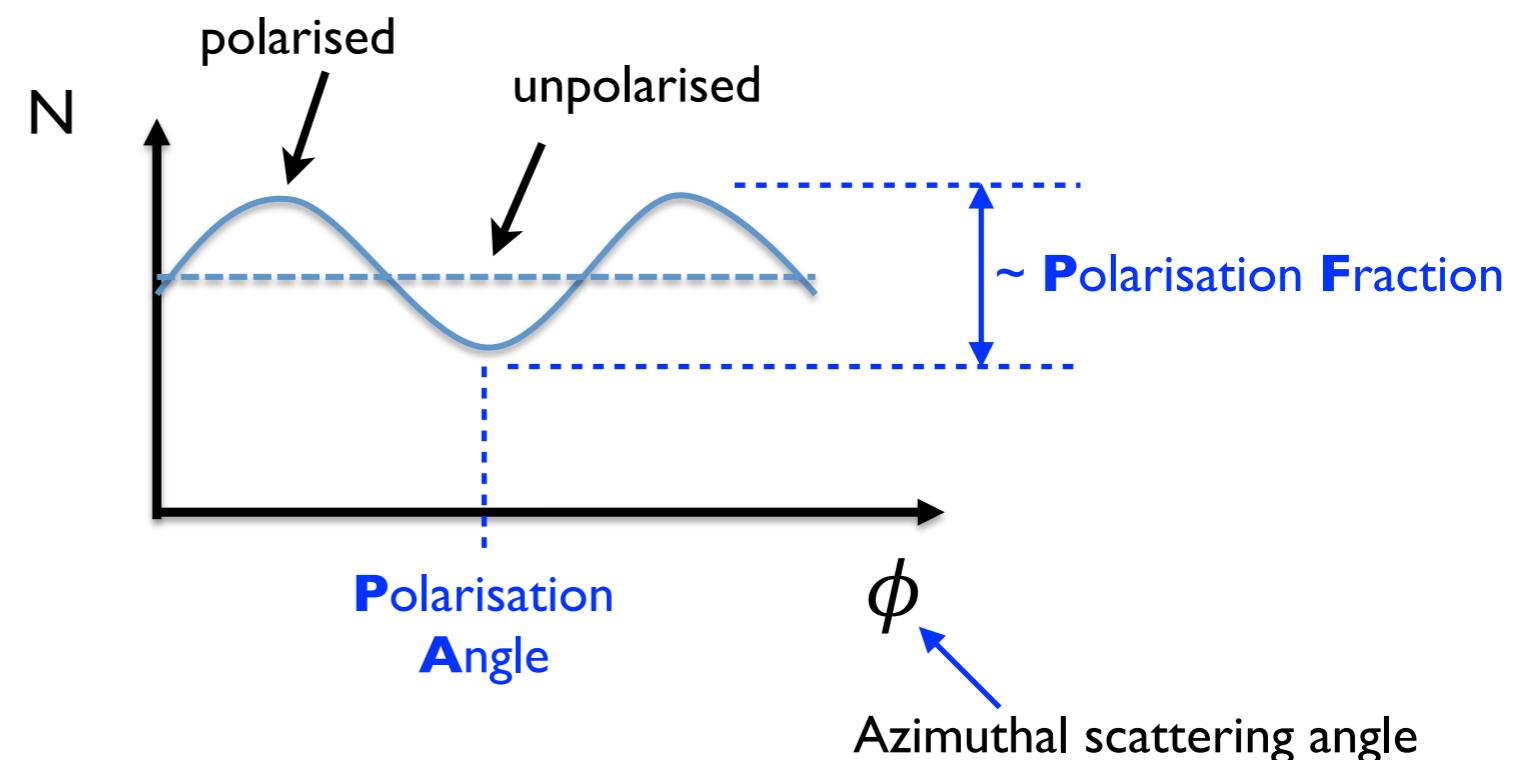

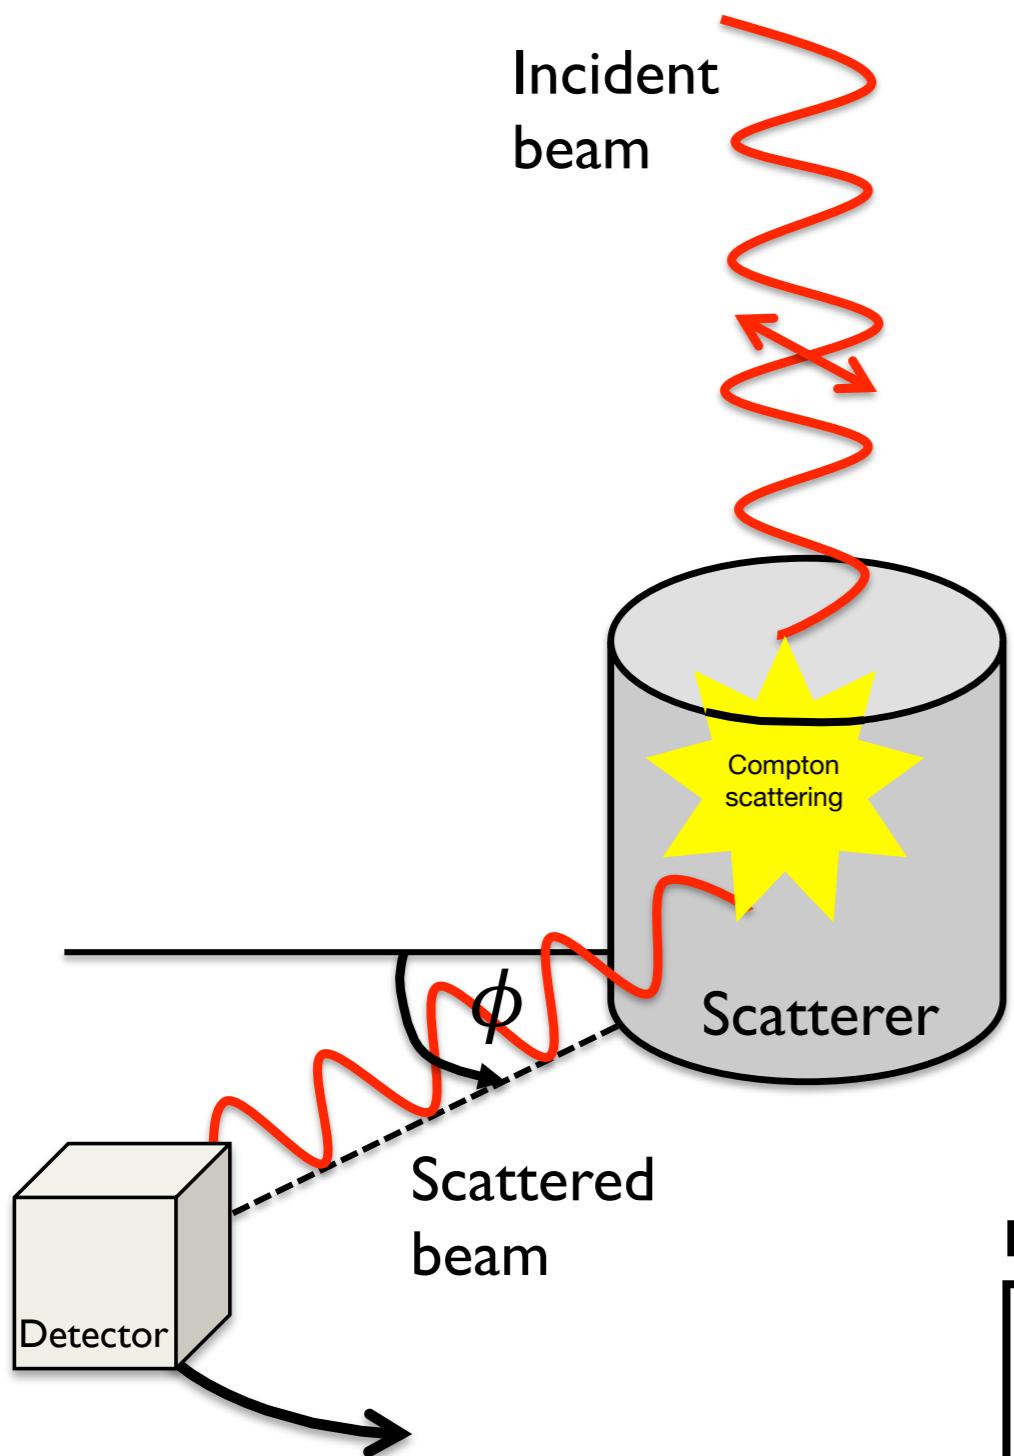

Reflection / scattering

- Polarisation probes coronal geometry close to the black hole

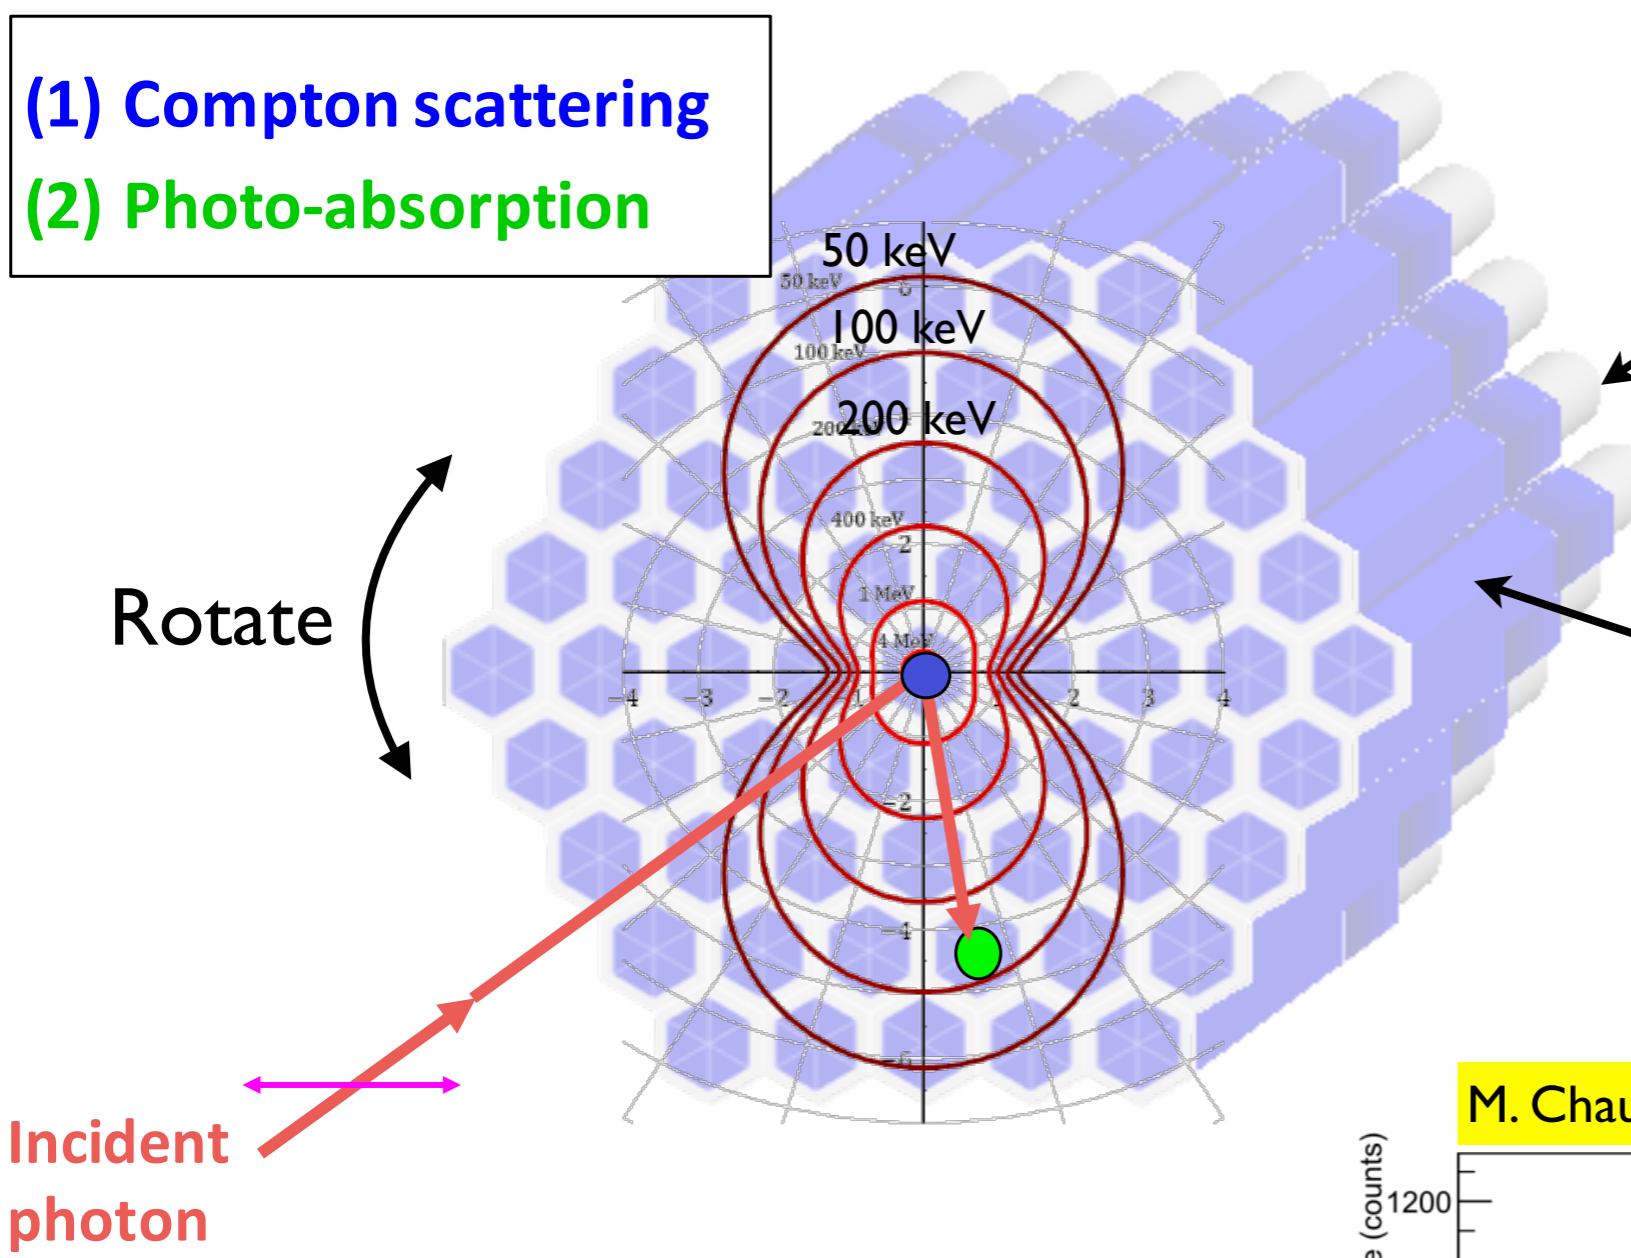

Measuring X-ray polarisation

Klein Nishina relationship

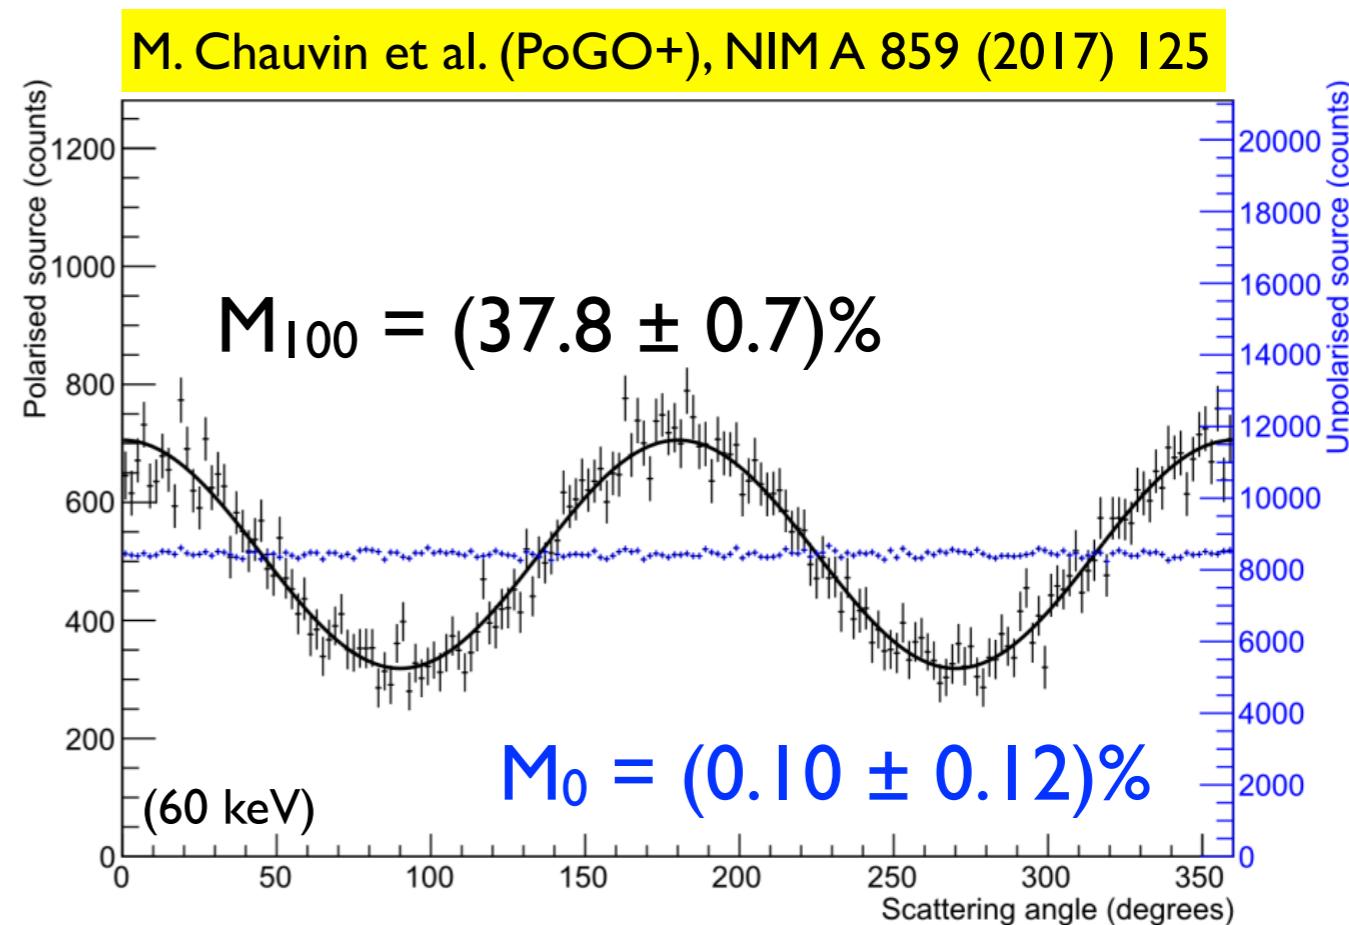

$$\frac{d\sigma}{d\Omega} = \frac{r_o^2}{2} \frac{E'^2}{E^2} \left(\frac{E'}{E} + \frac{E}{E'} - 2 \sin^2 \theta \cos^2 \phi \right)$$

- (1) Compton scattering
- (2) Photo-absorption

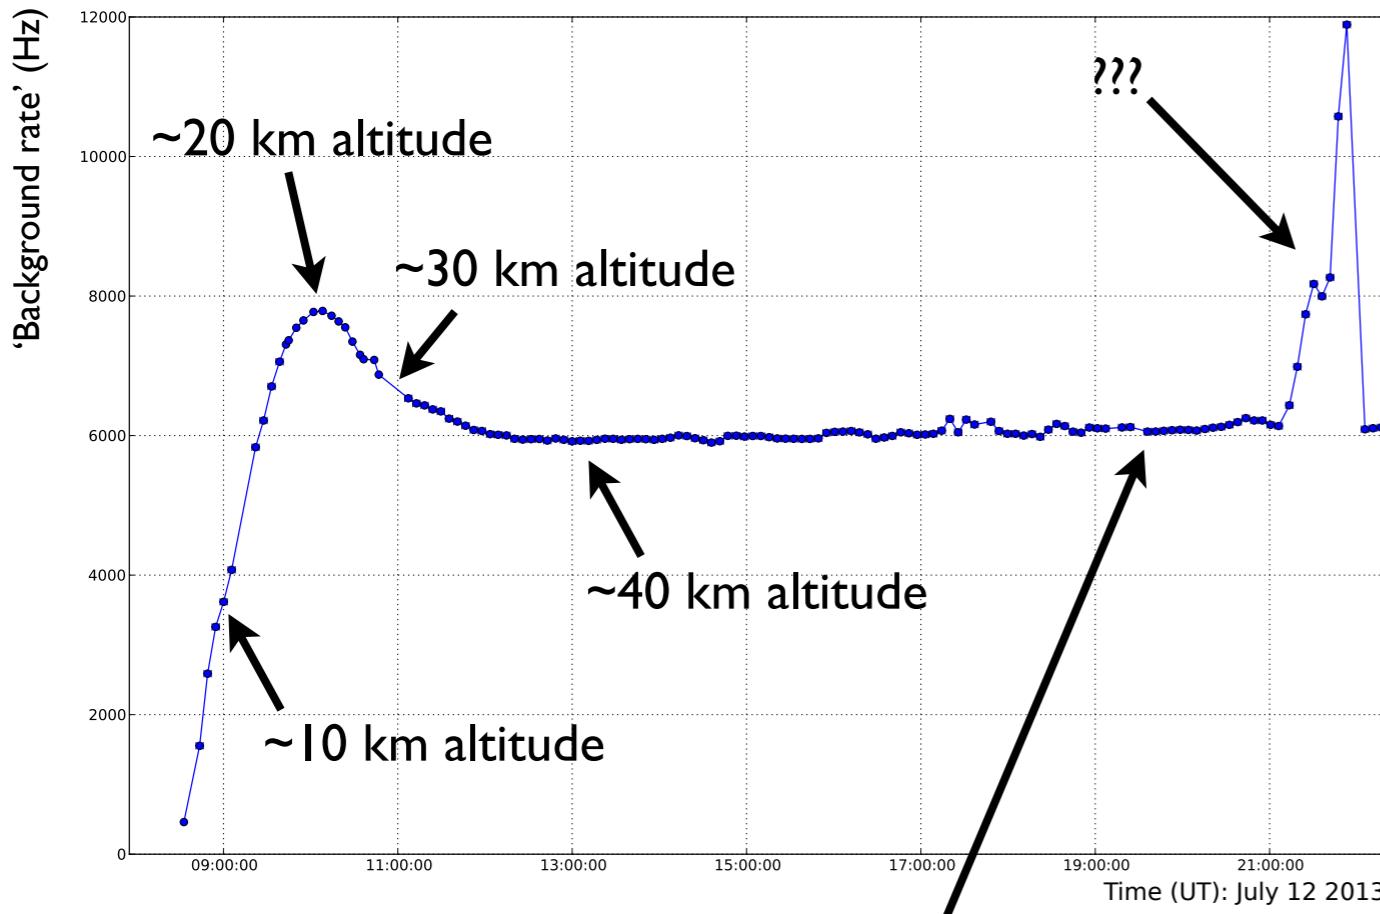

- The distribution of azimuthal scattering angles defines the polarisation of the incident beam

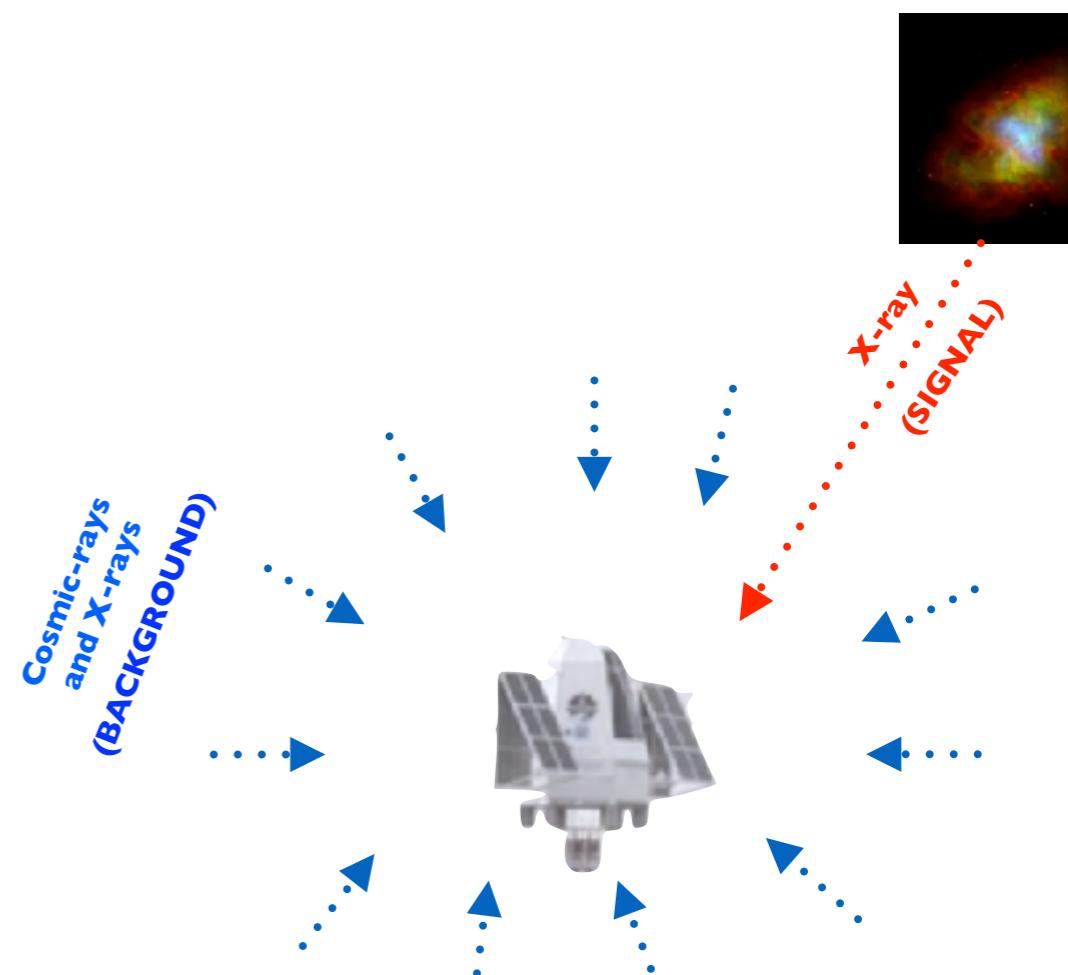

• Positive definite measurement.
Preflight calibration with (un-)polarised X-ray beams essential.

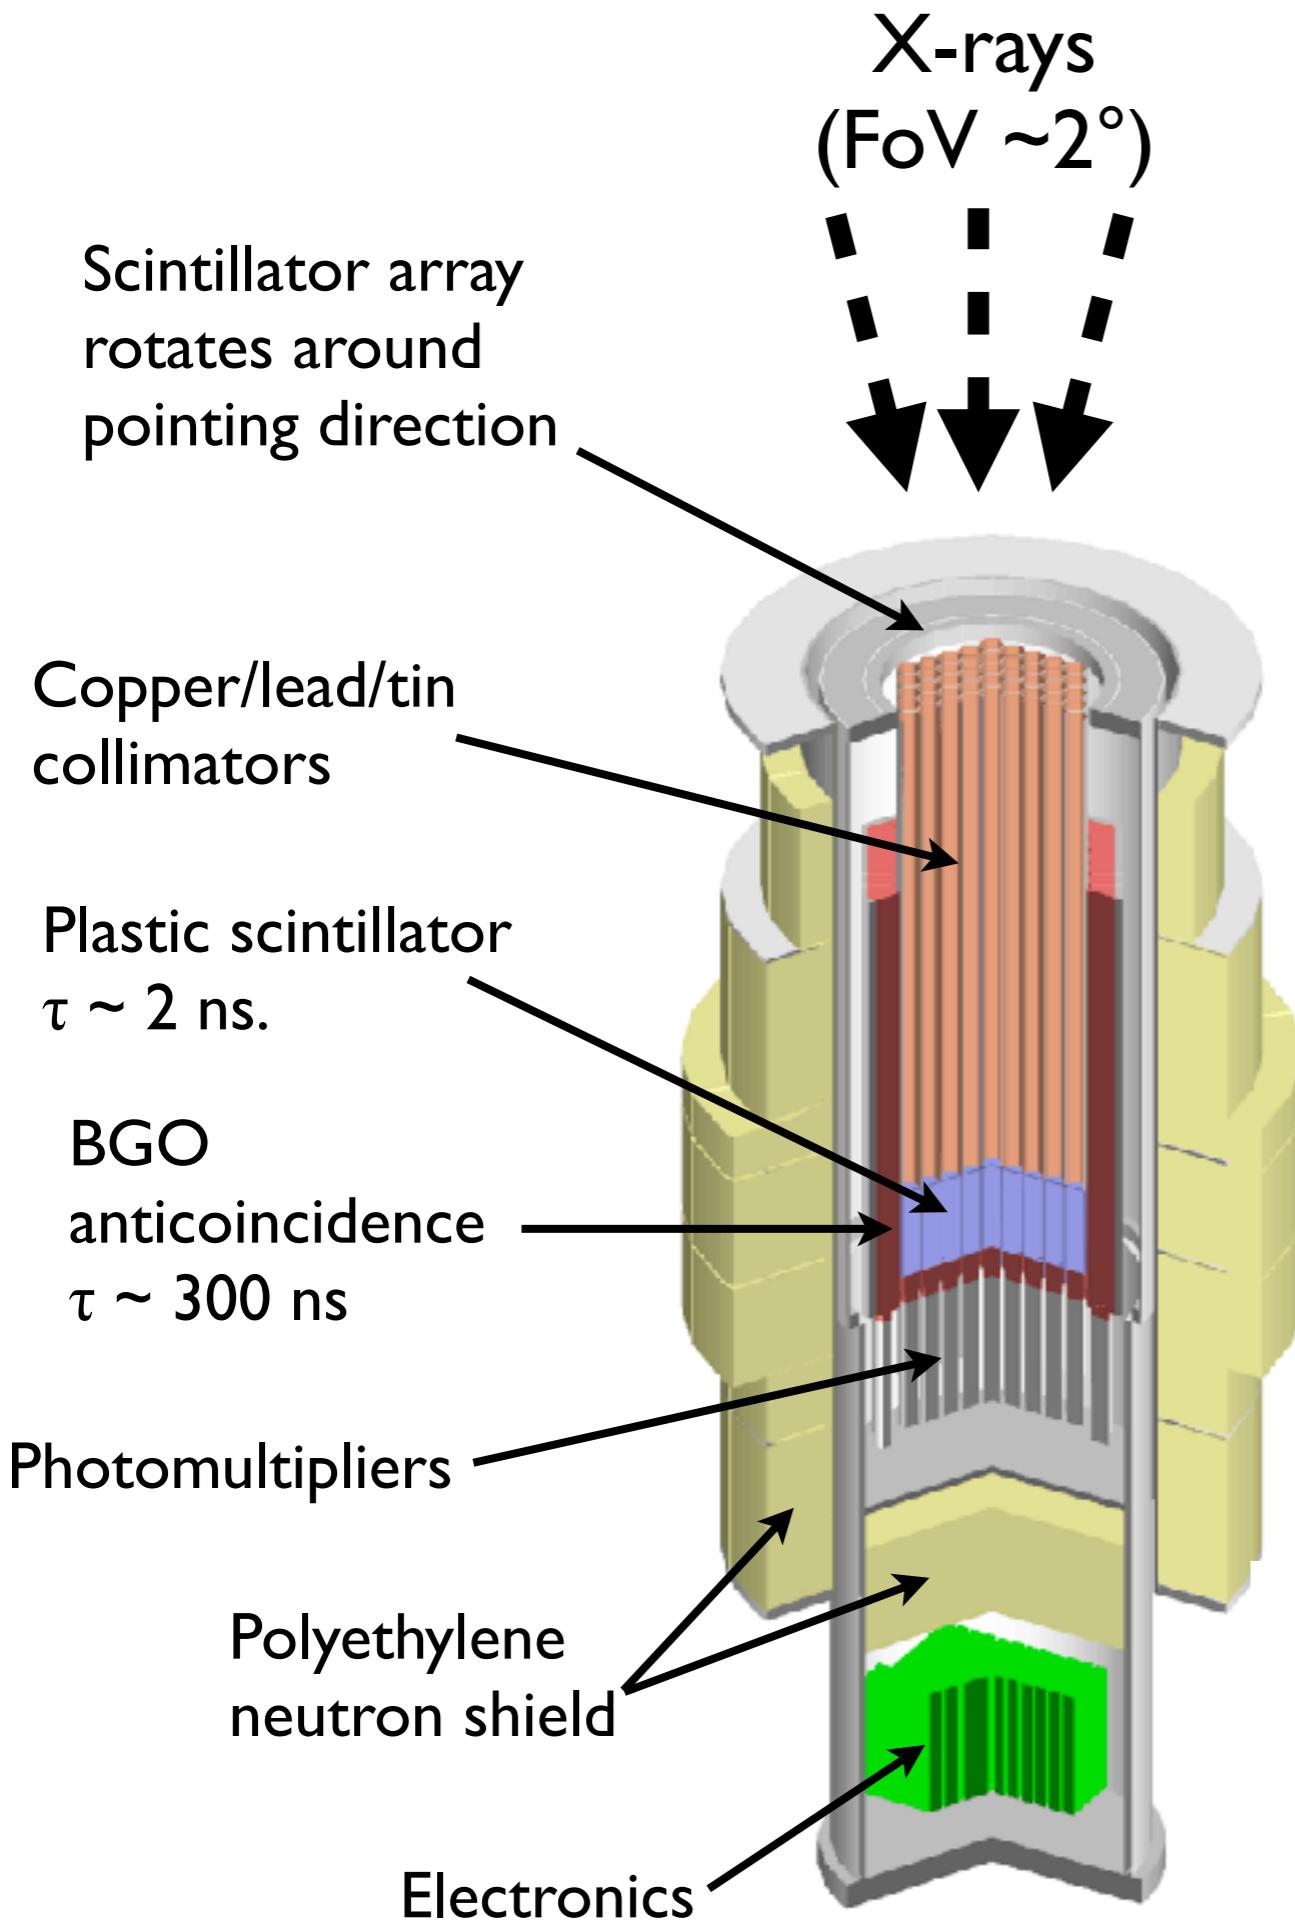

Radiation environment

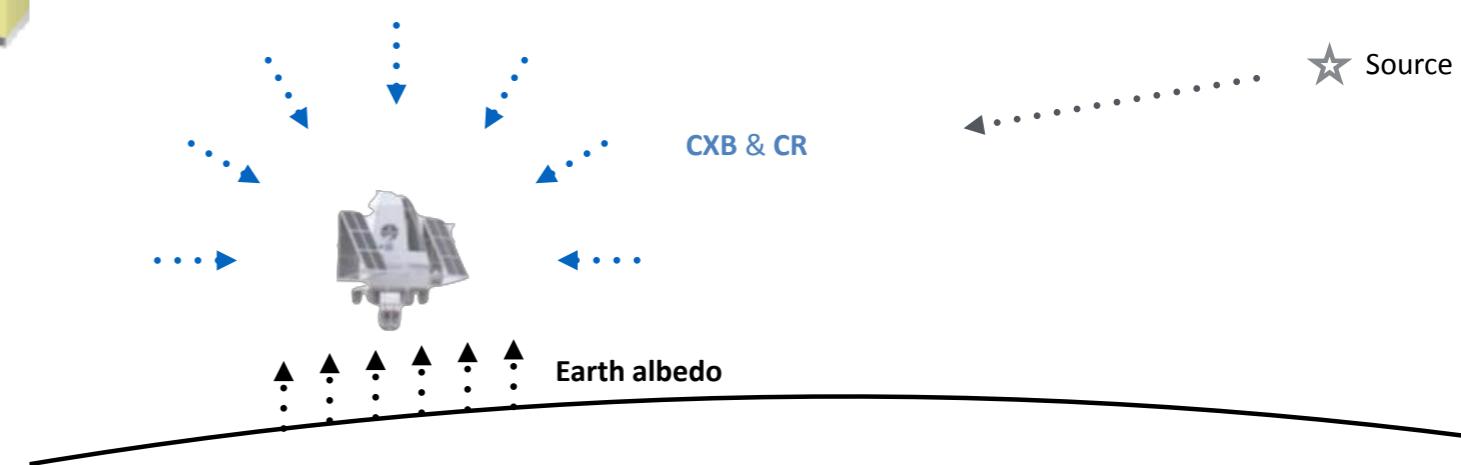

Understanding the details of this 'background' rate is crucial to a convincing polarisation measurement!

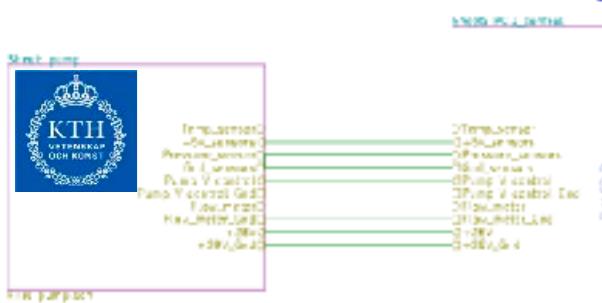

Robust measurement requires:

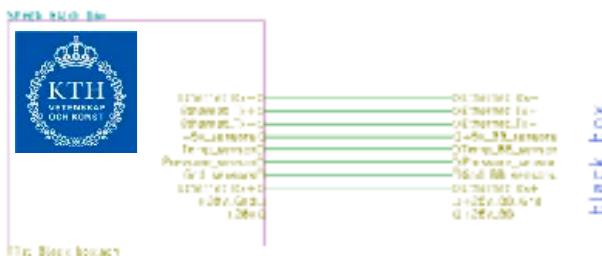

- (1) purpose-built and calibrated instrument (positive definite measurement)
- (2) Multiple background rejection methods

Polarimeter

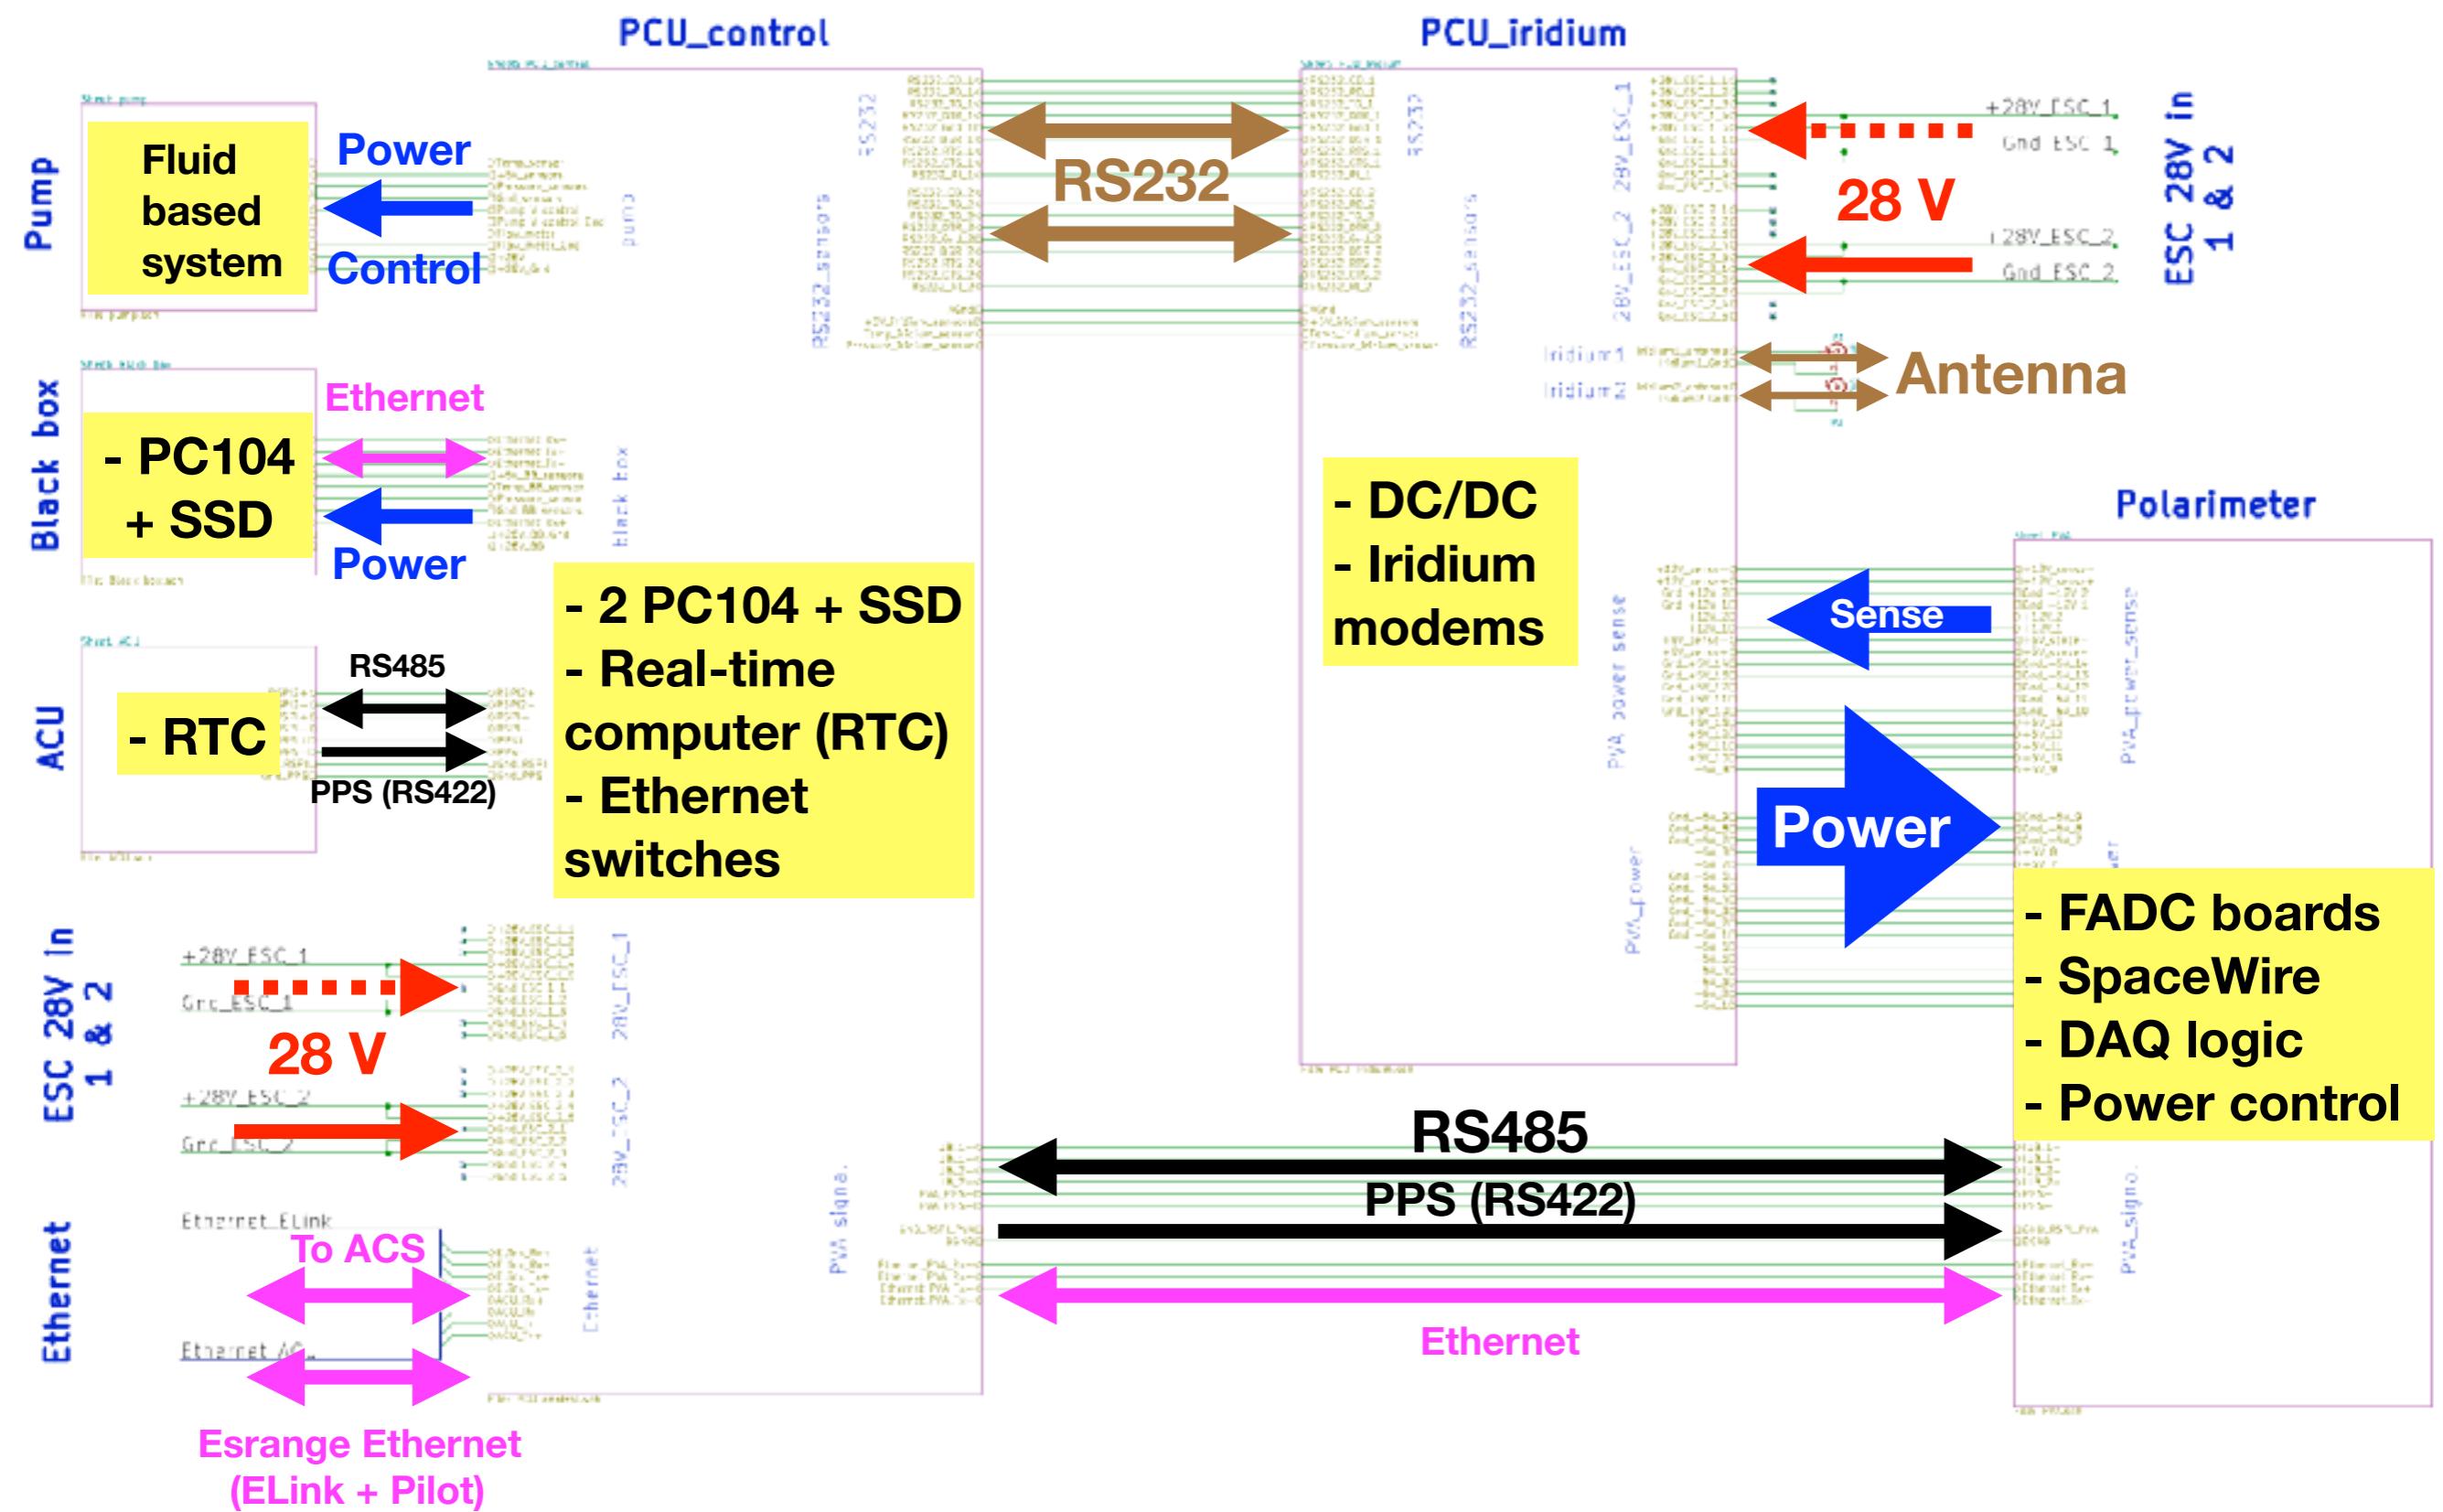

PVA signal

88_PVA

PVA signal

88_PVA

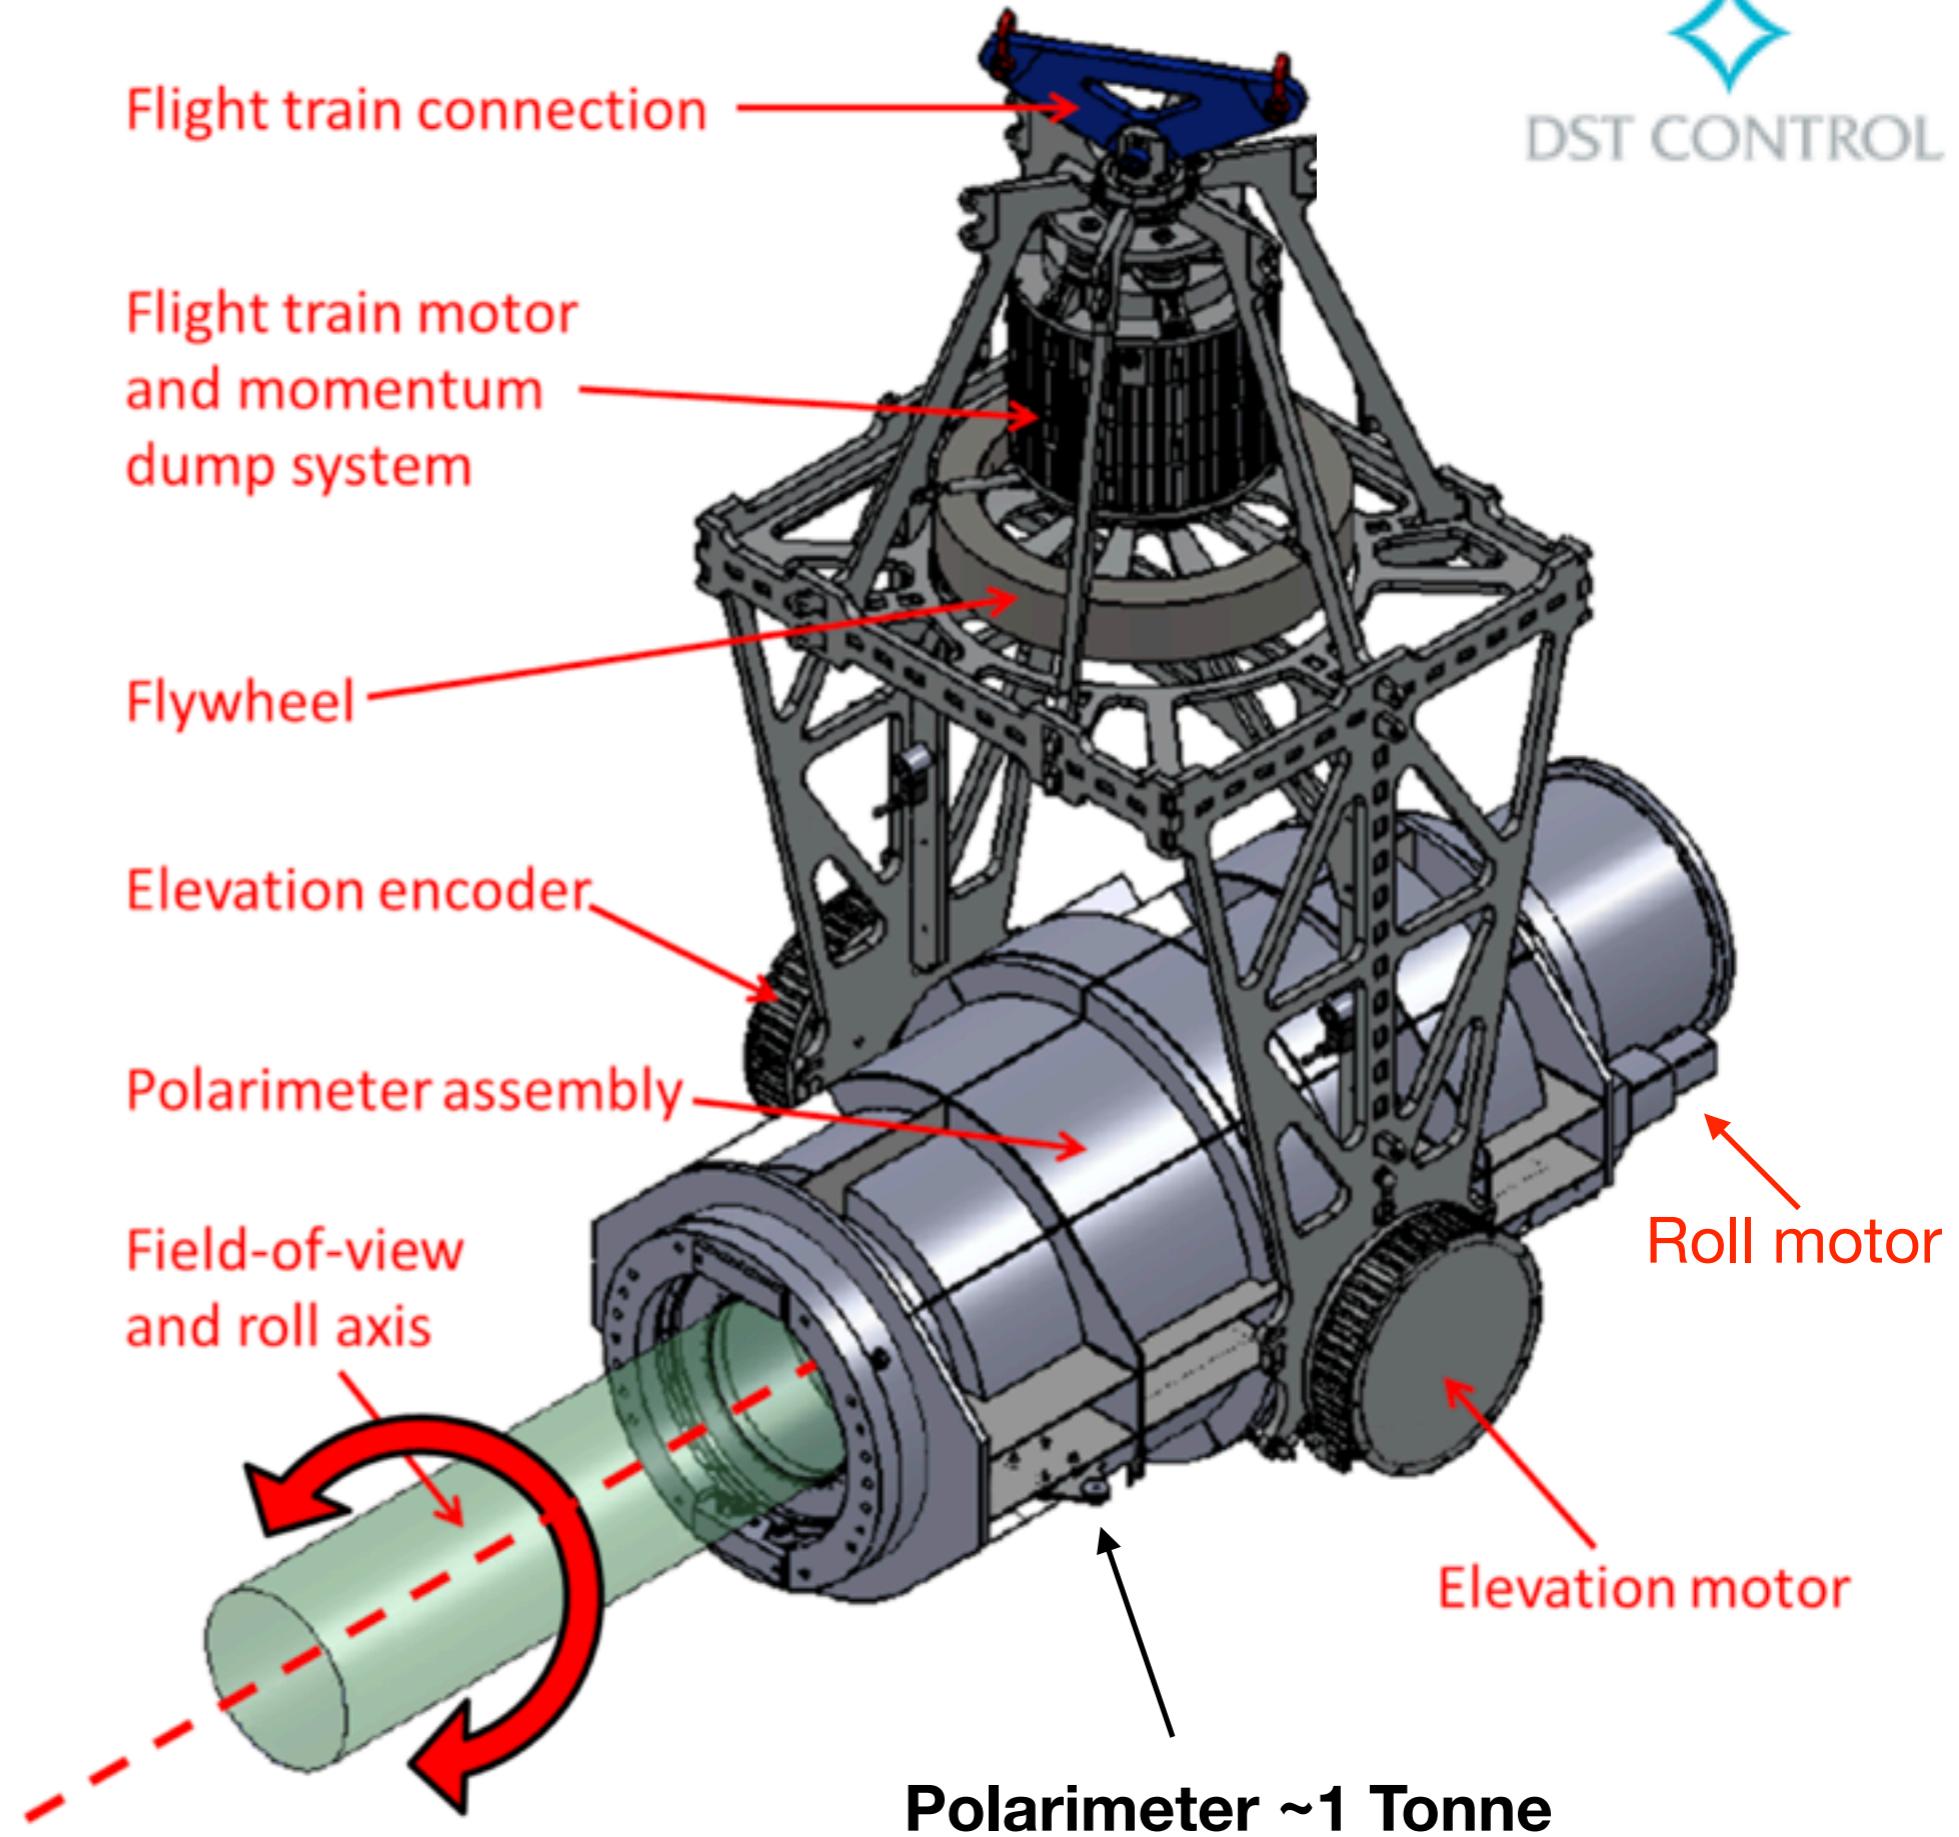

NB: sensor connections (pressure, temp, etc.) not shown

DST CONTROL

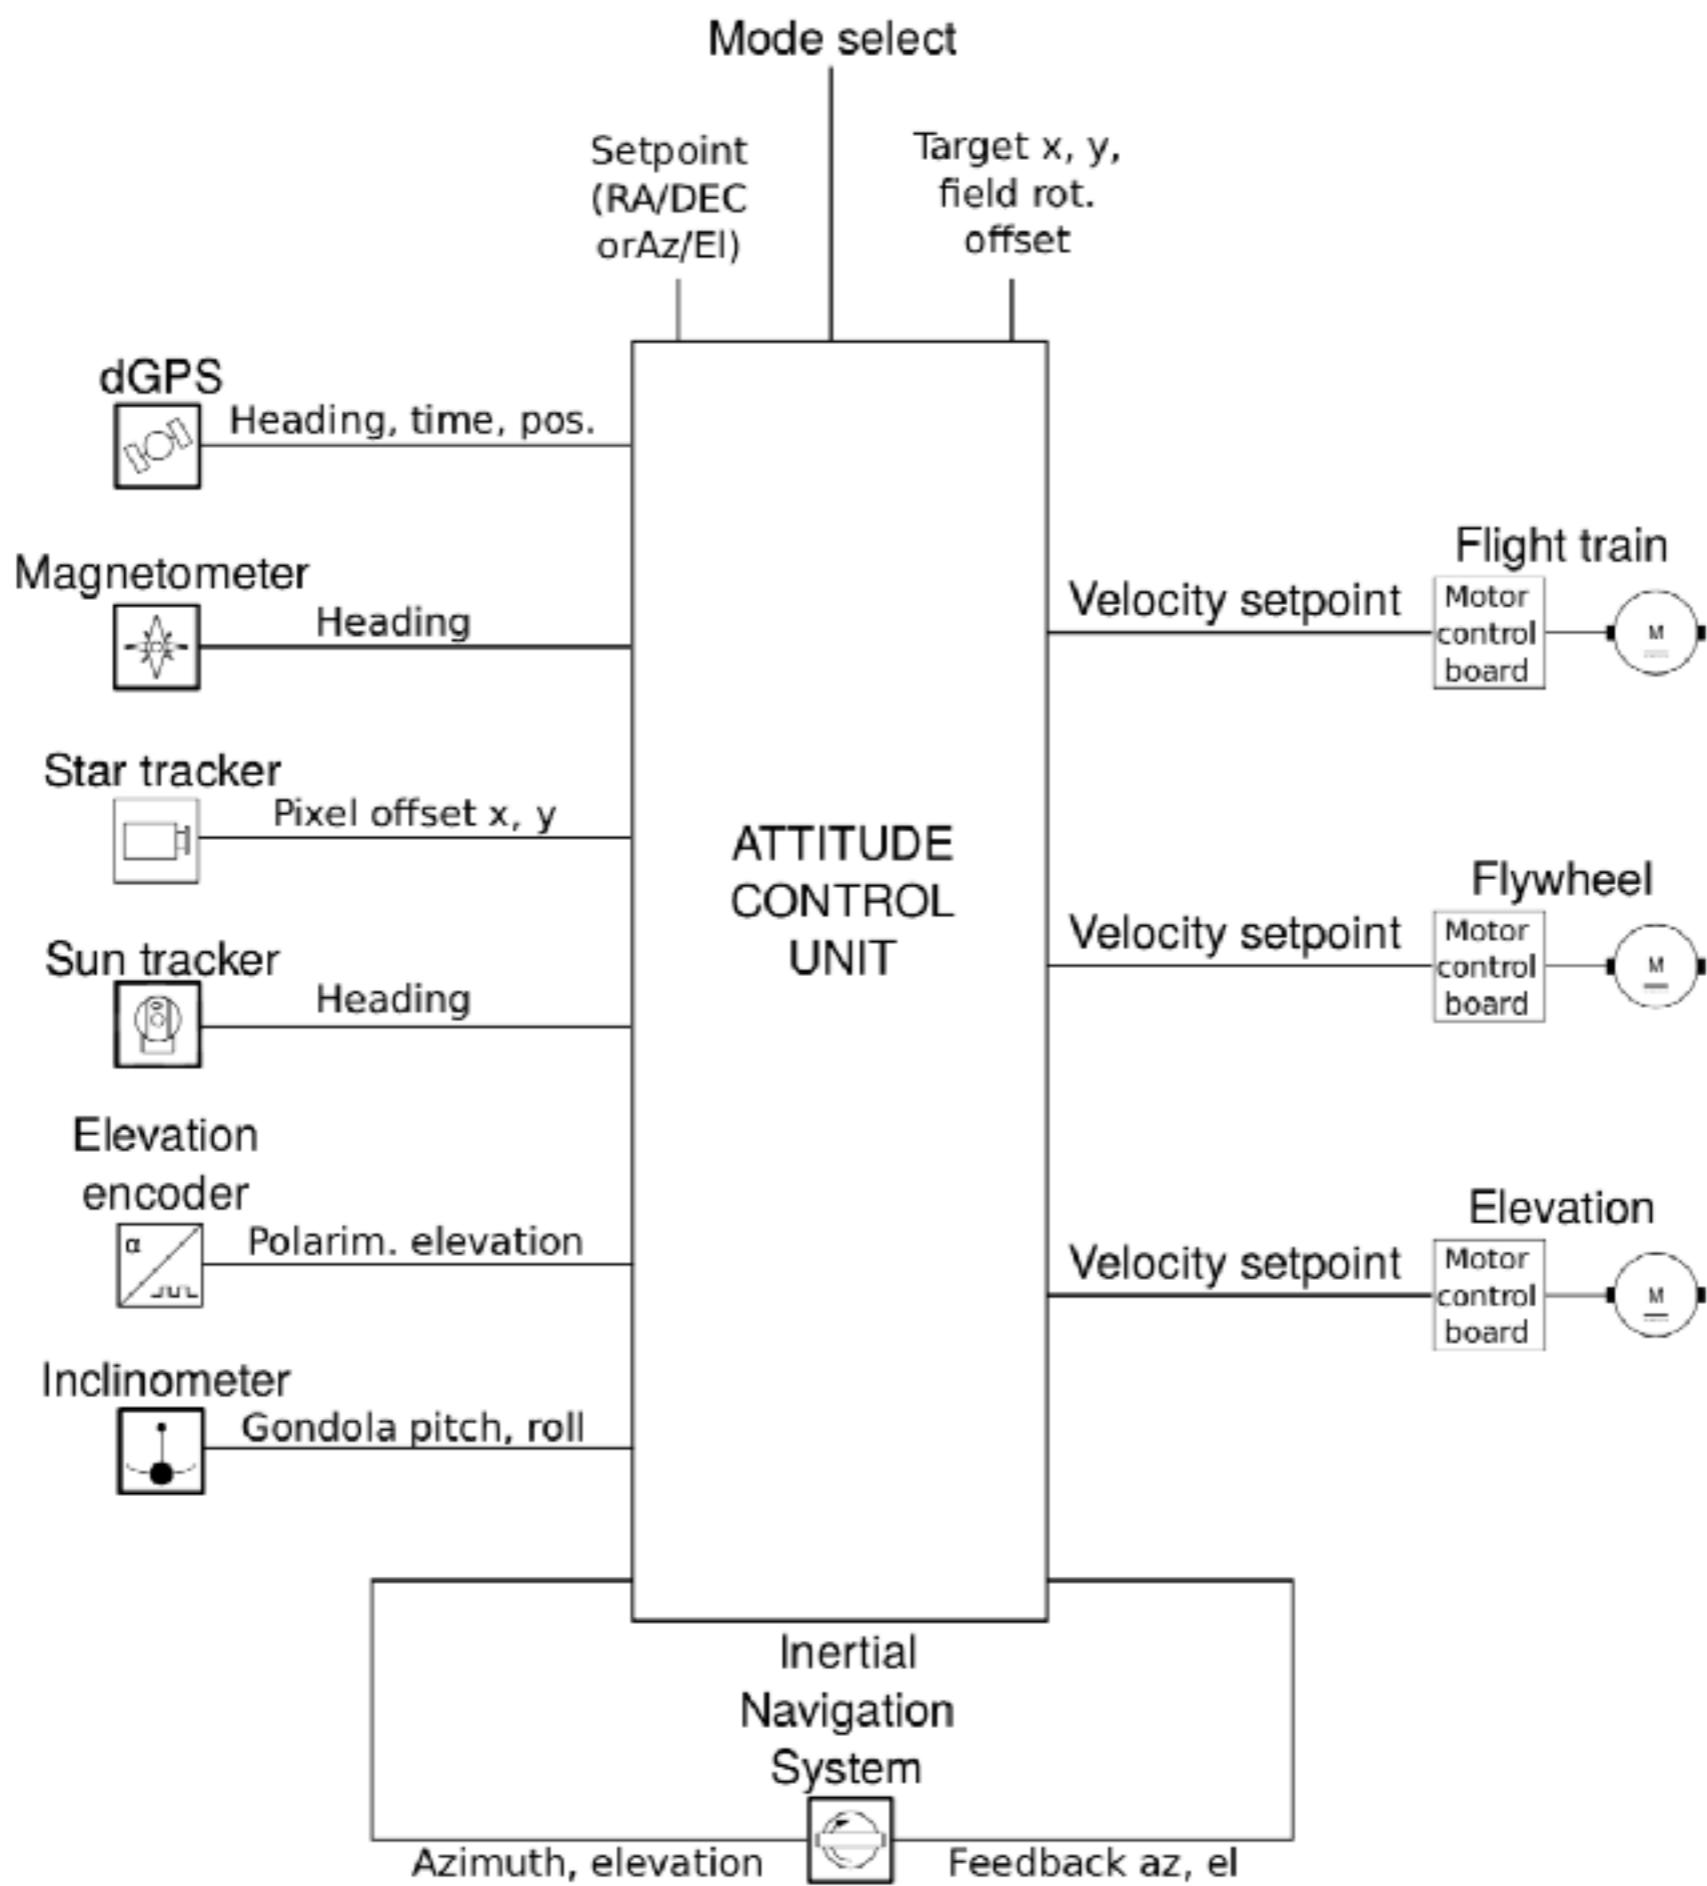

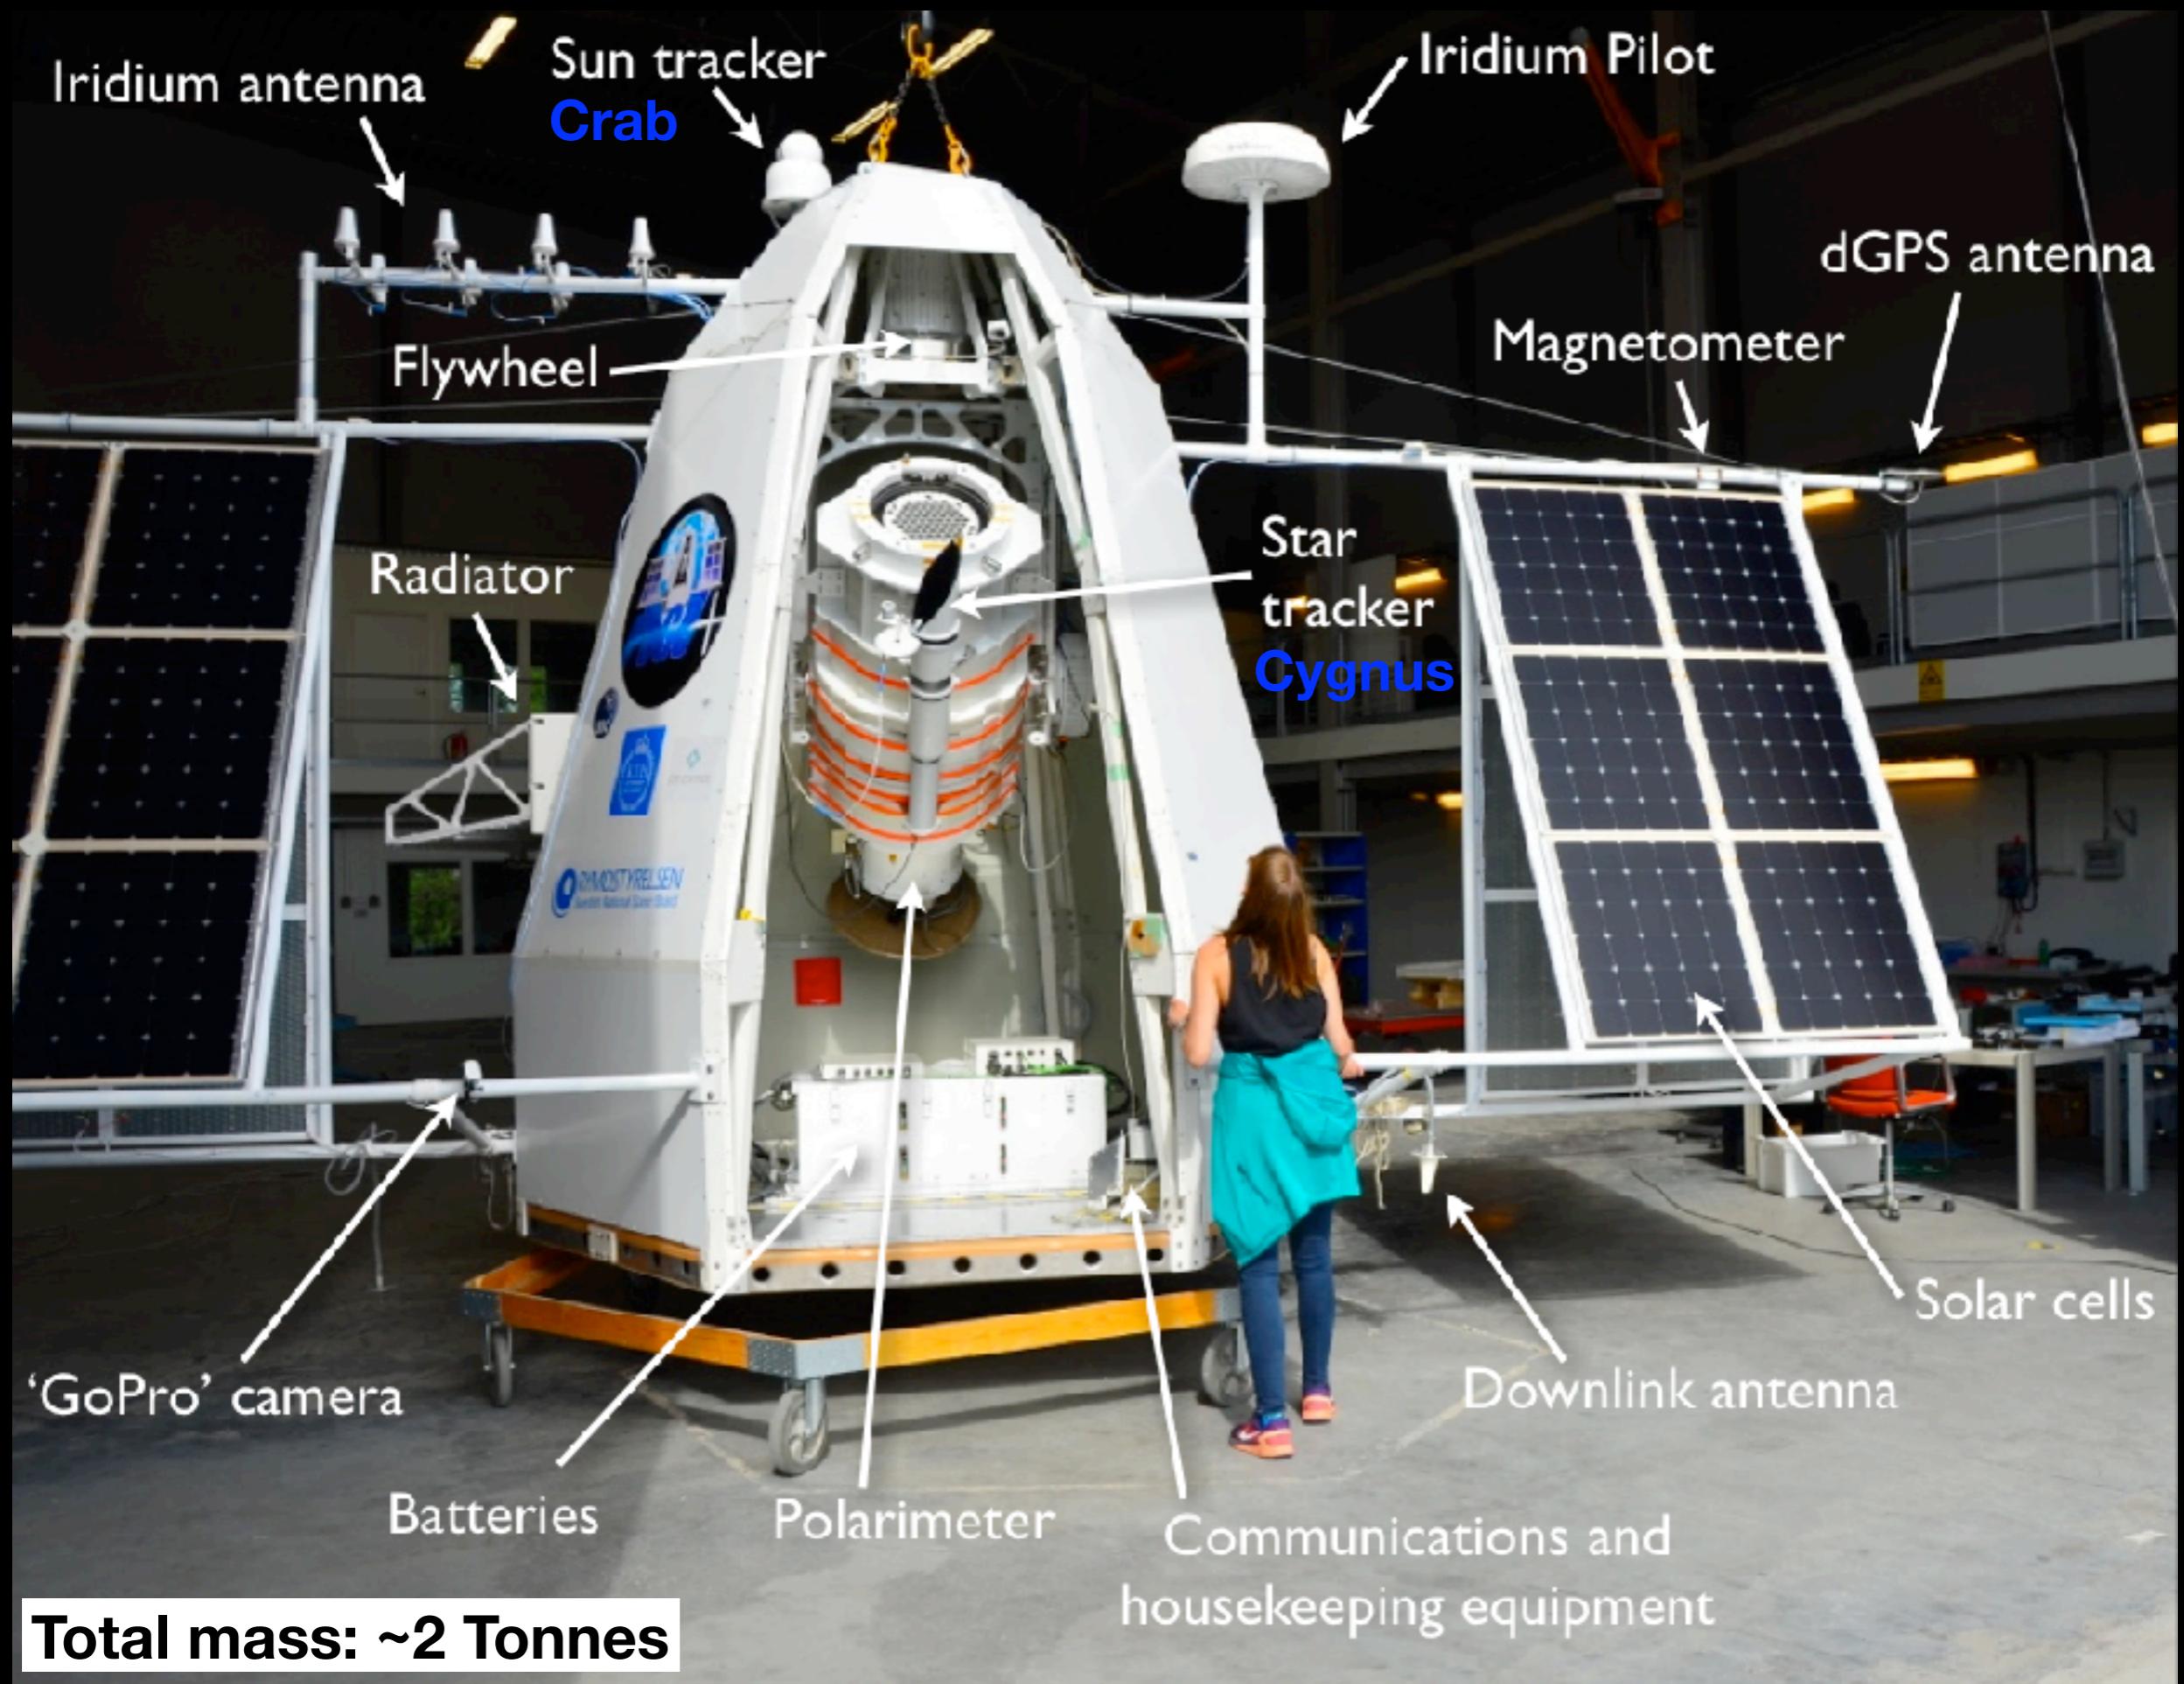

- Innovation: digital direct drive torque motors
- **Entire system is ITAR-free**

DST CONTROL

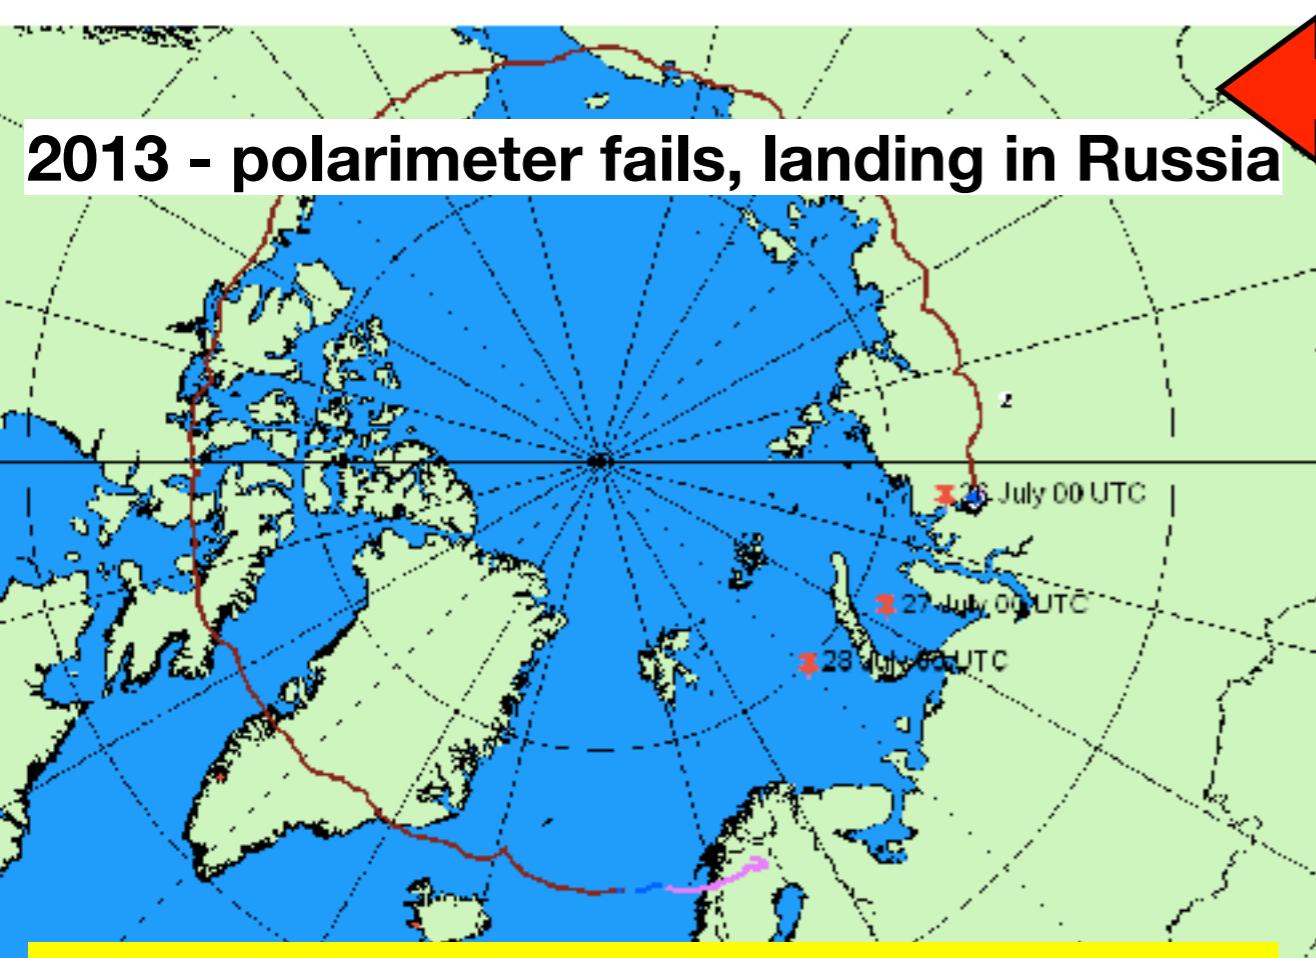

2010 - NASA equipment grounded

2011 - balloon damaged on launch

2013 - polarimeter fails, landing in Russia

2012 - poor weather, no launch

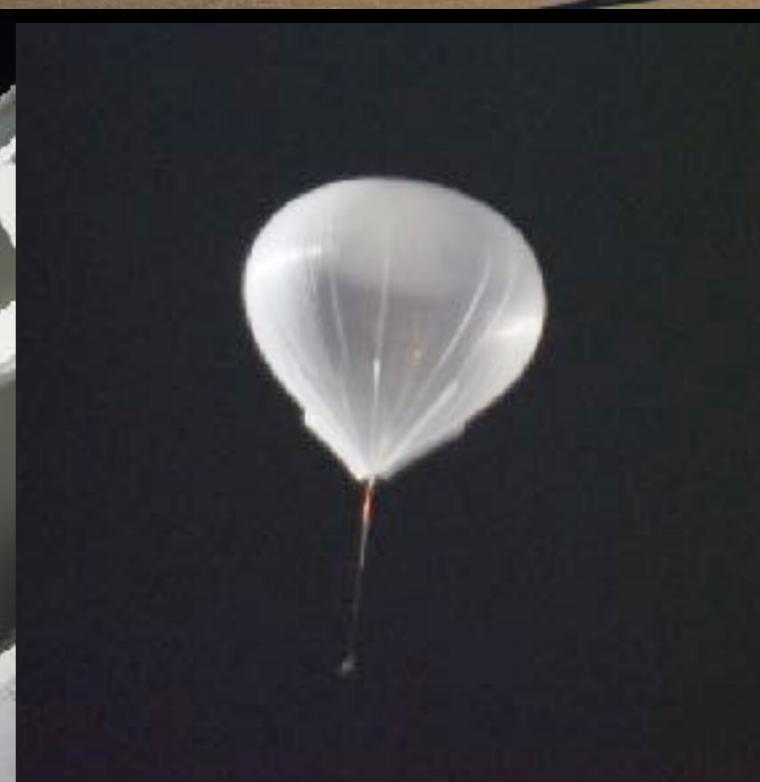

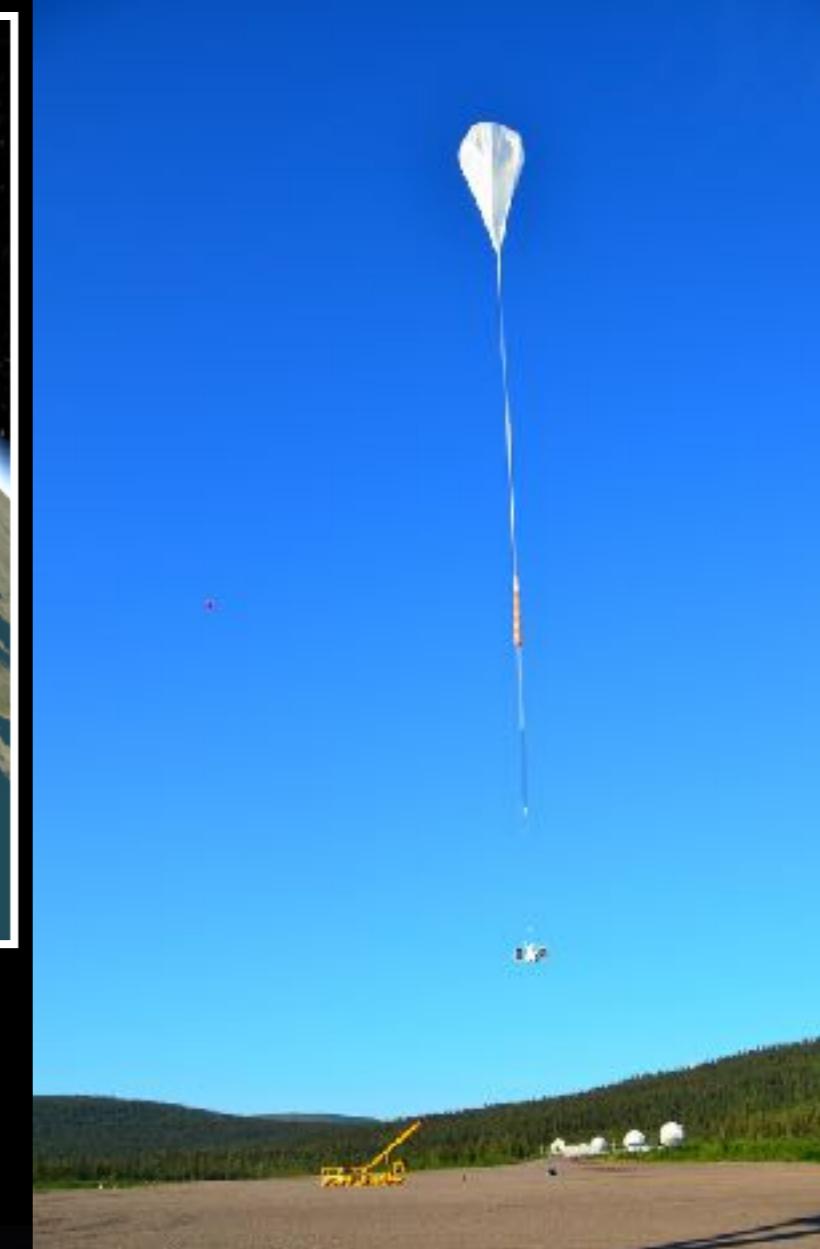

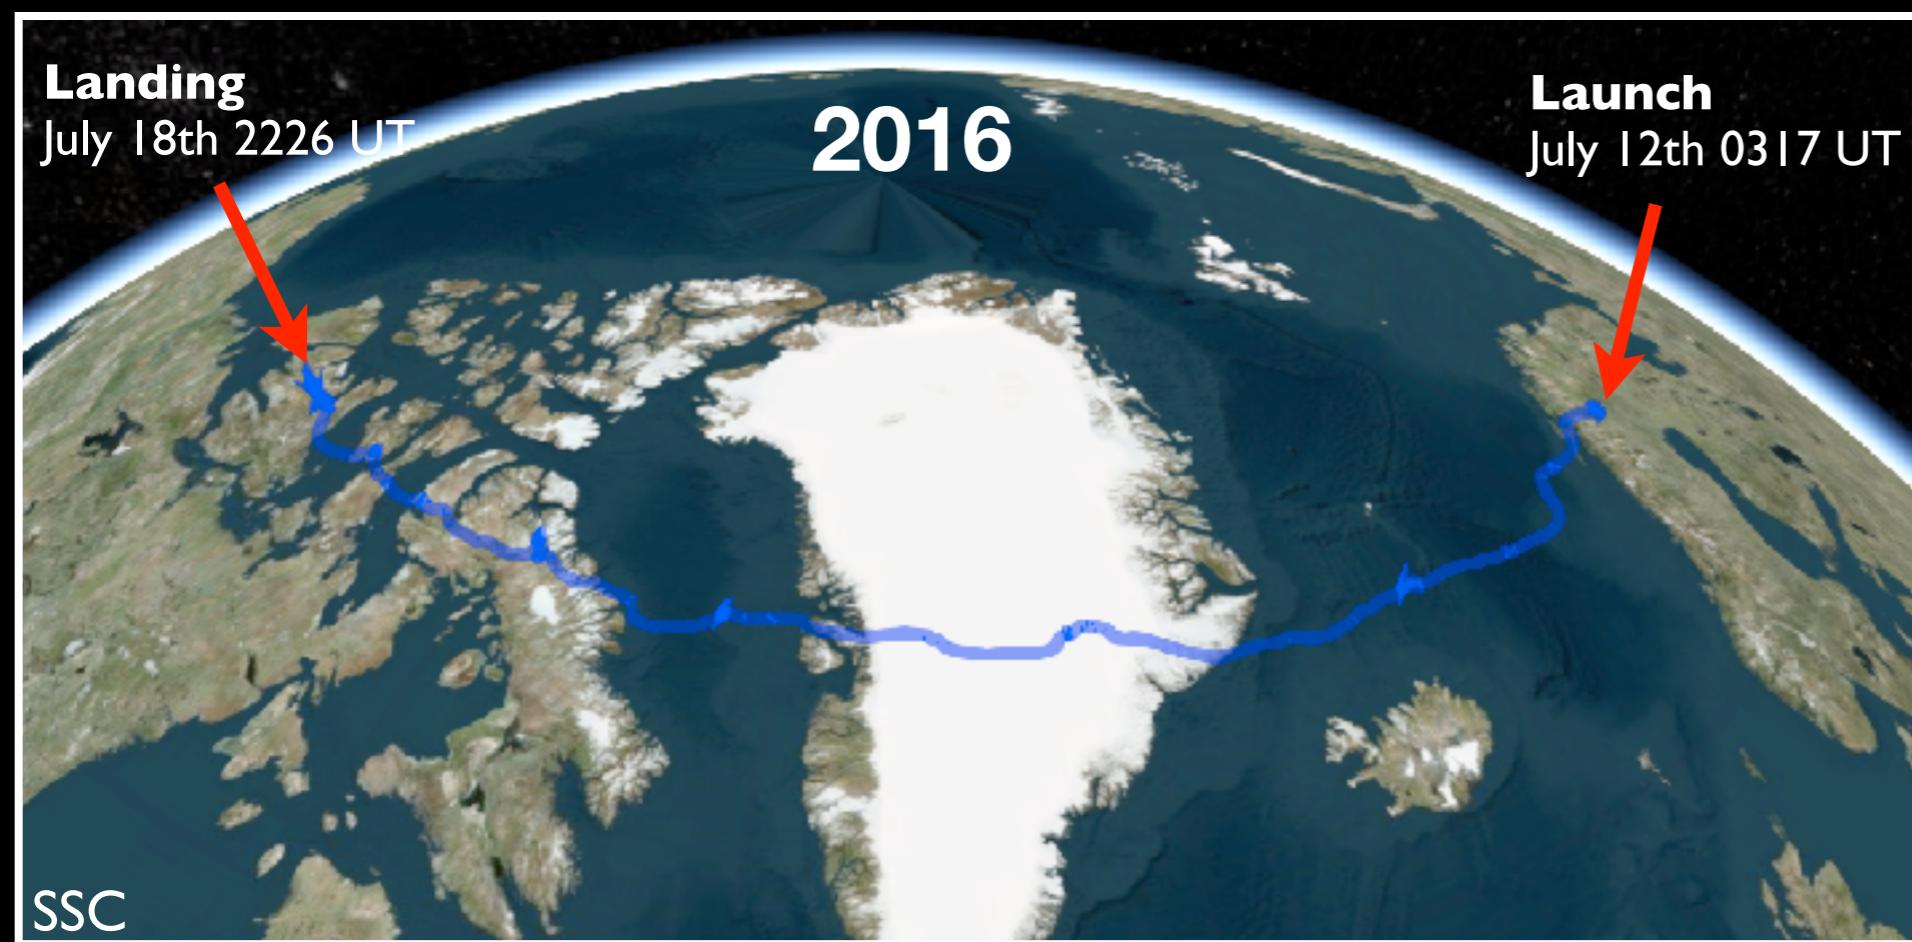

A first look at Crab polarisation:

M. Chauvin et al., MNRAS Letters 456 (2016) 84.

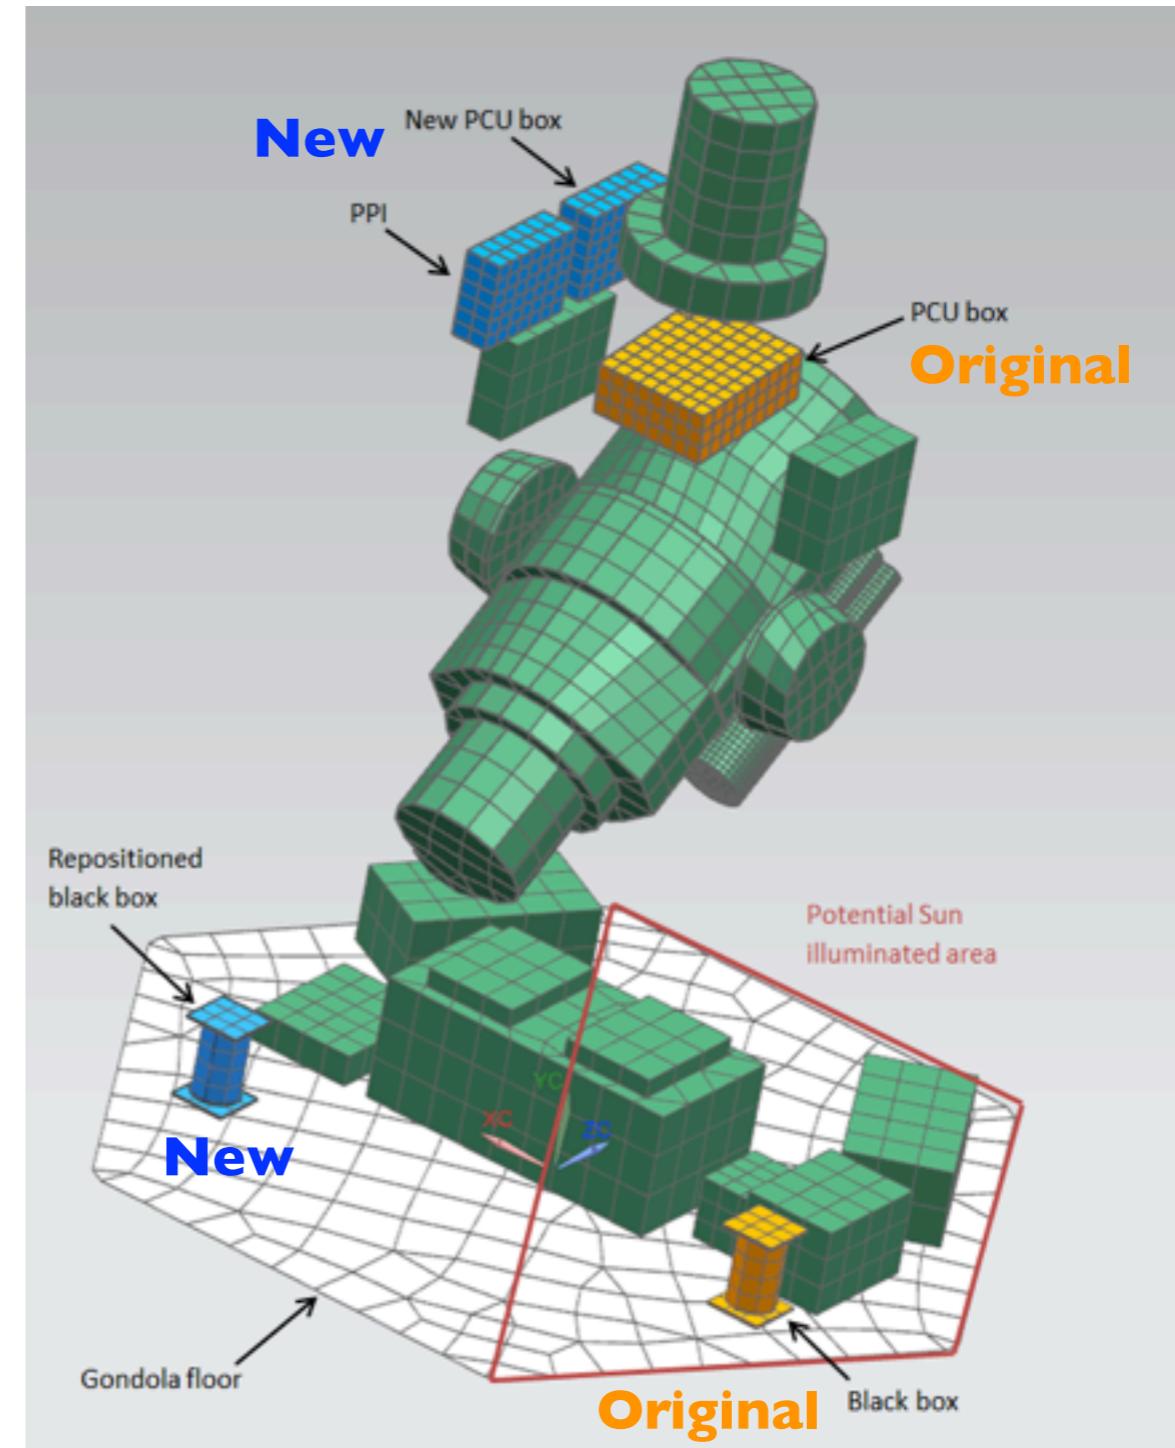

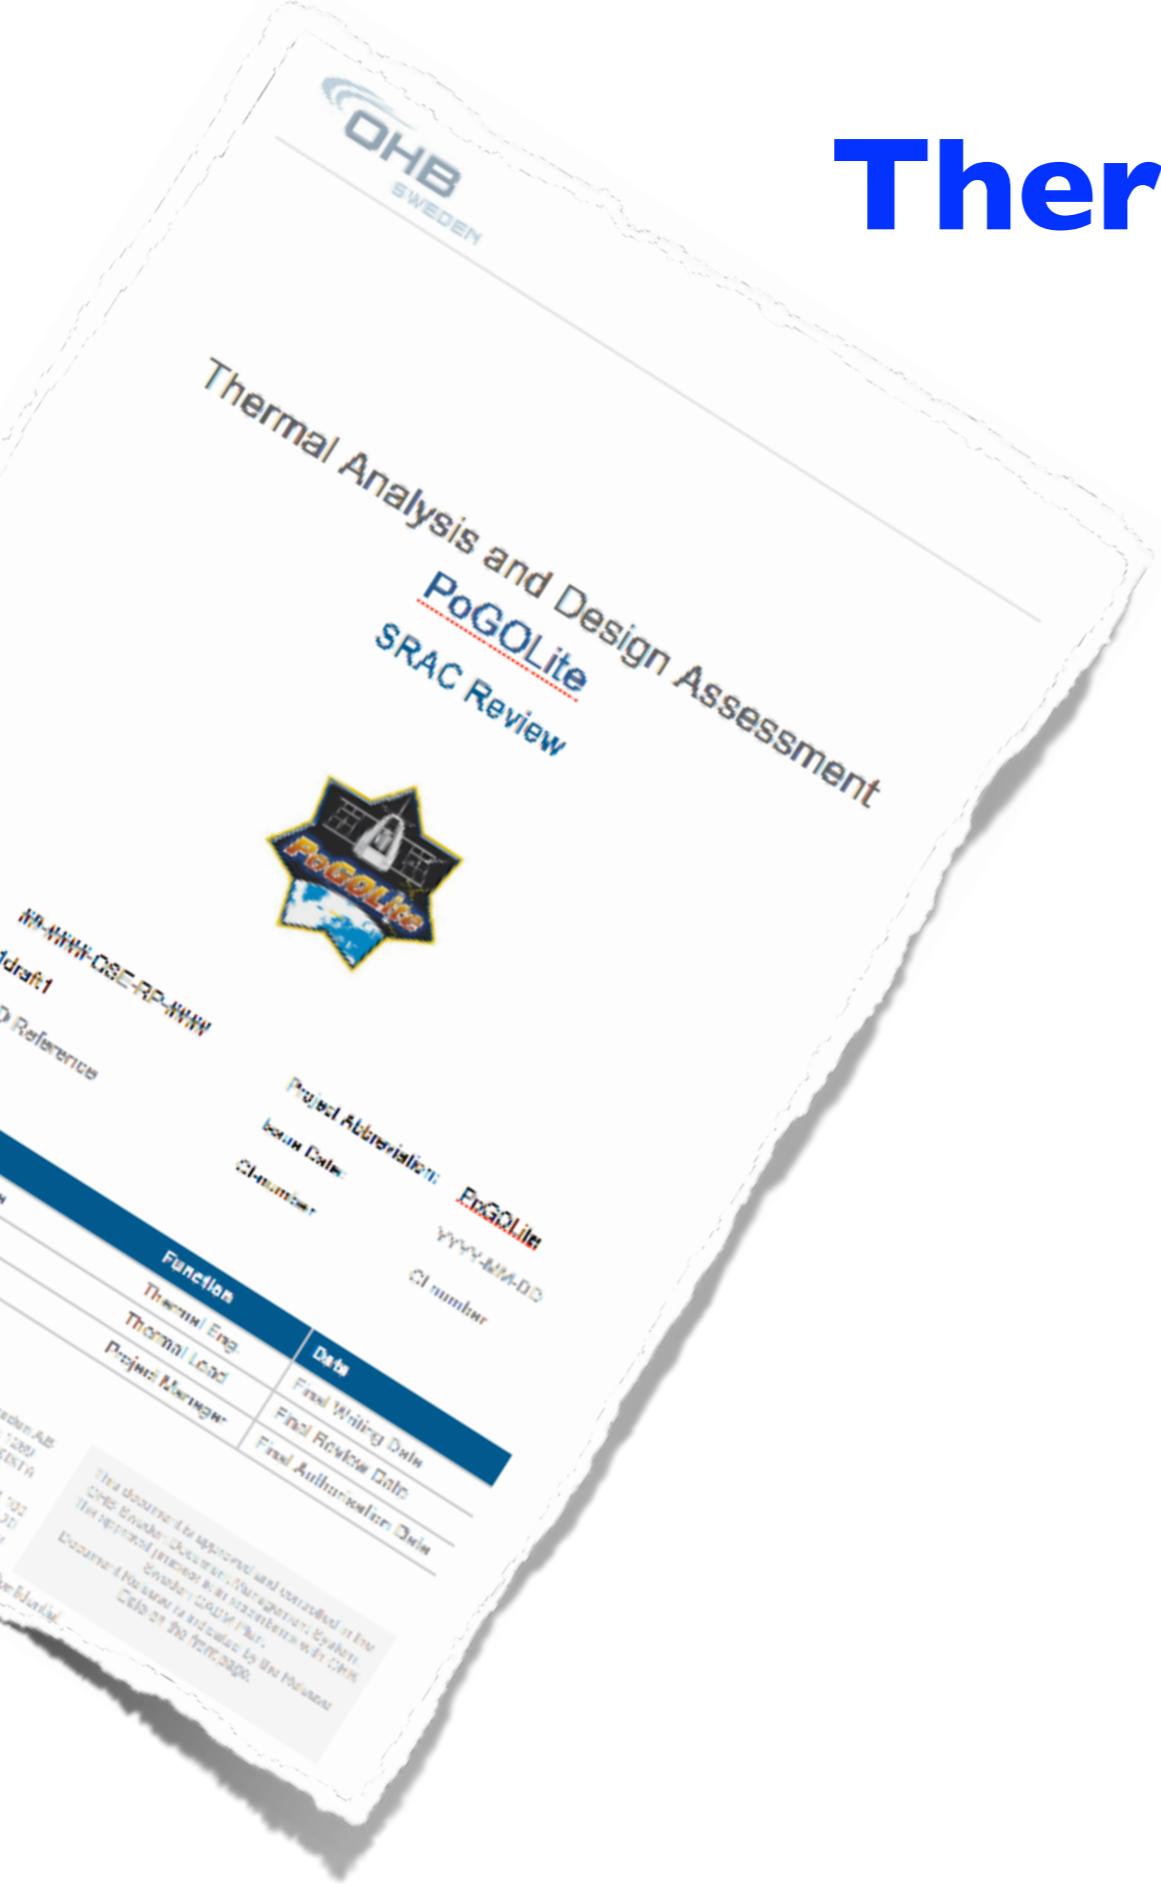

Landing
July 18th 2226 UT

2016

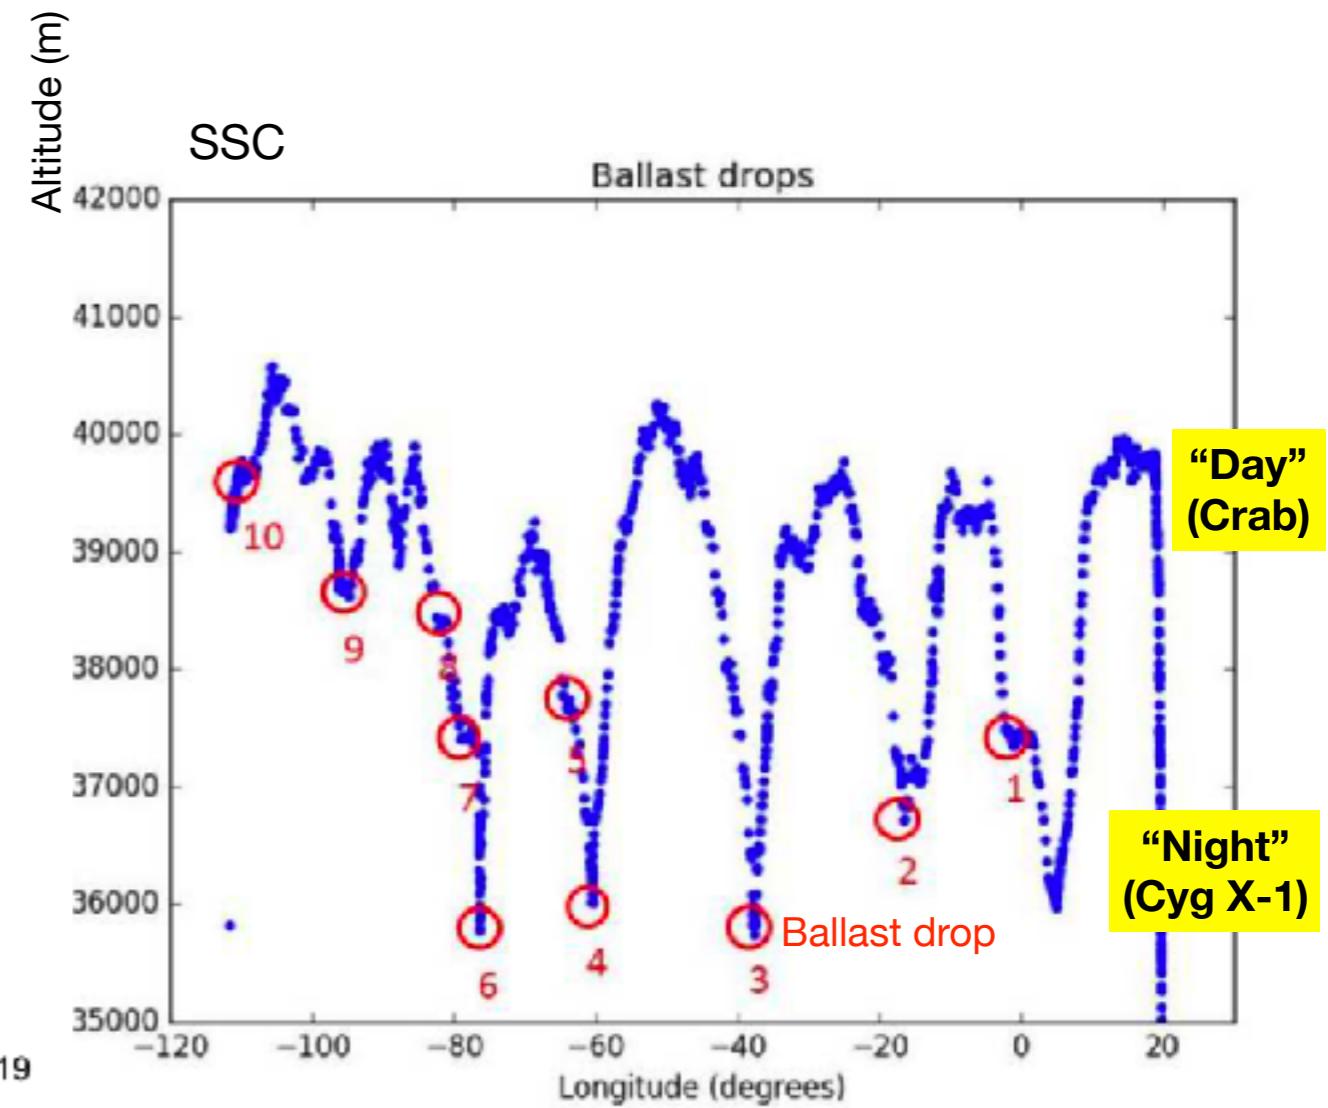

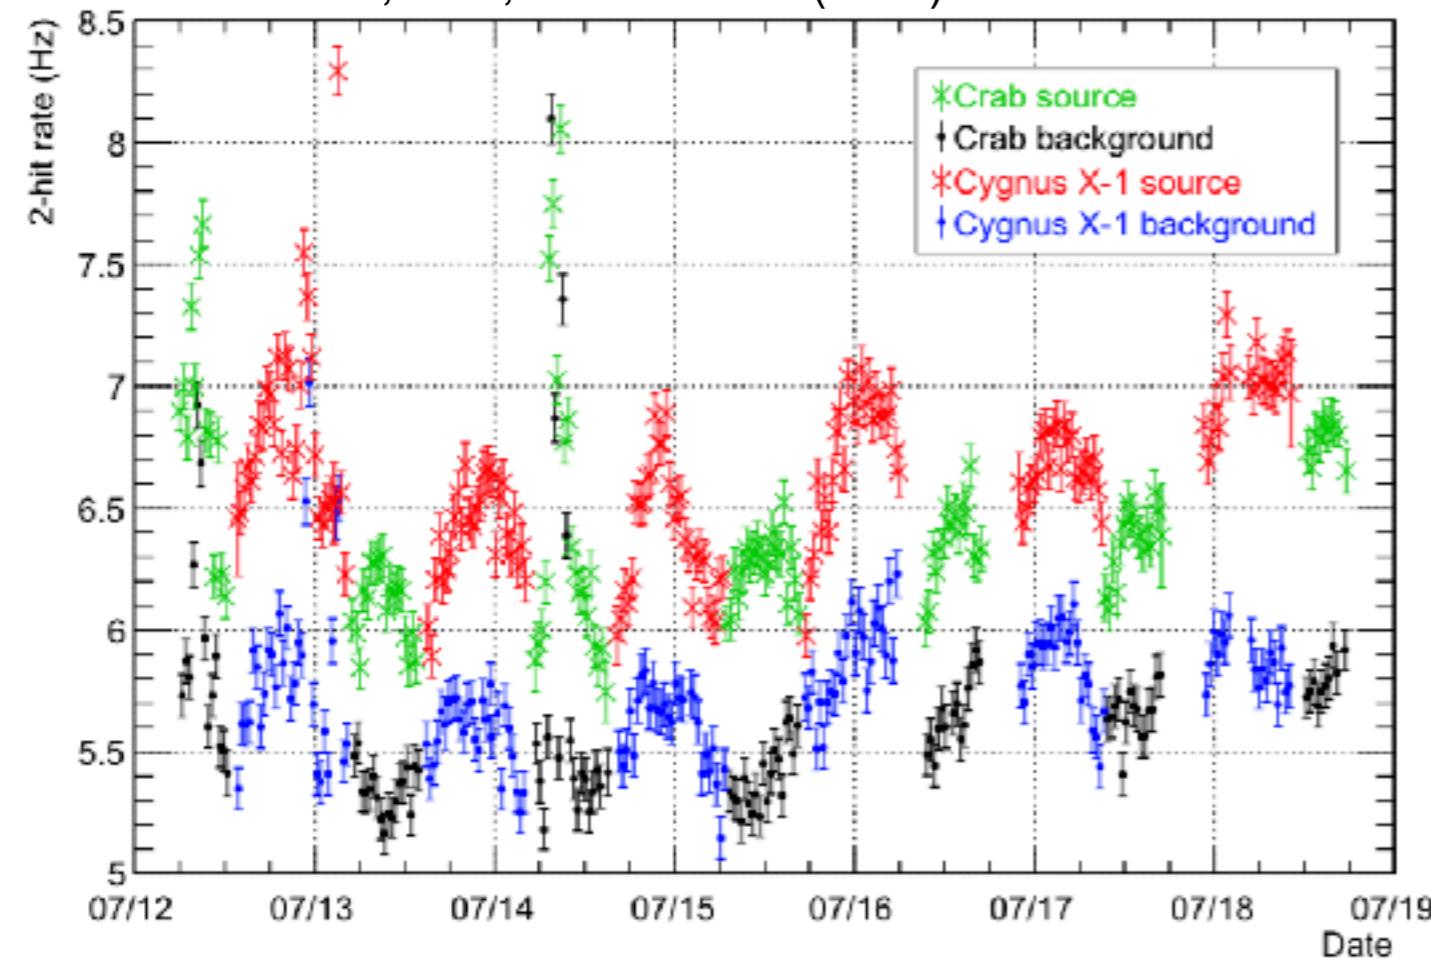

Launch
July 12th 0317 UT

Thermal review

Extremely important!

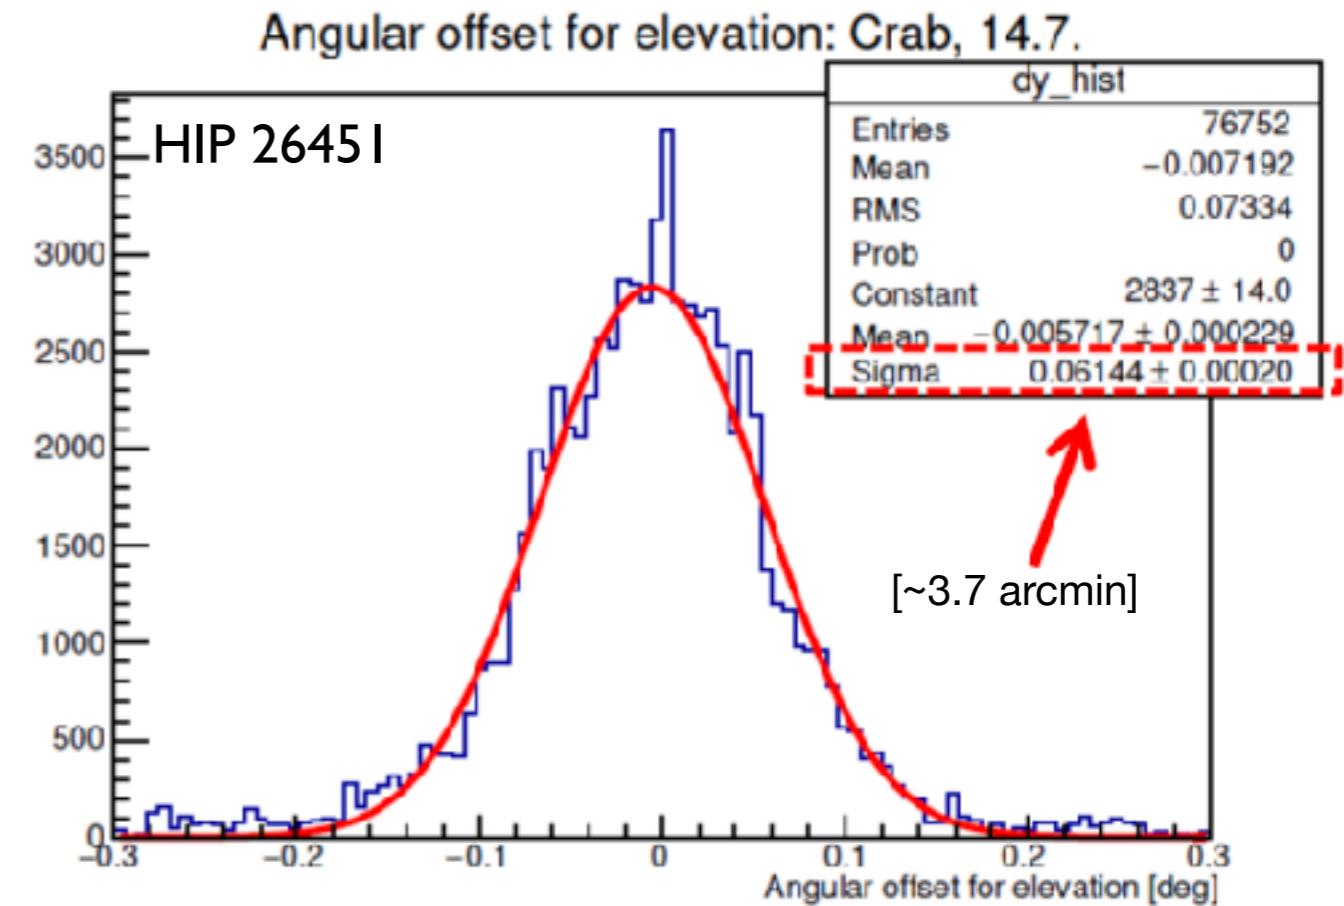

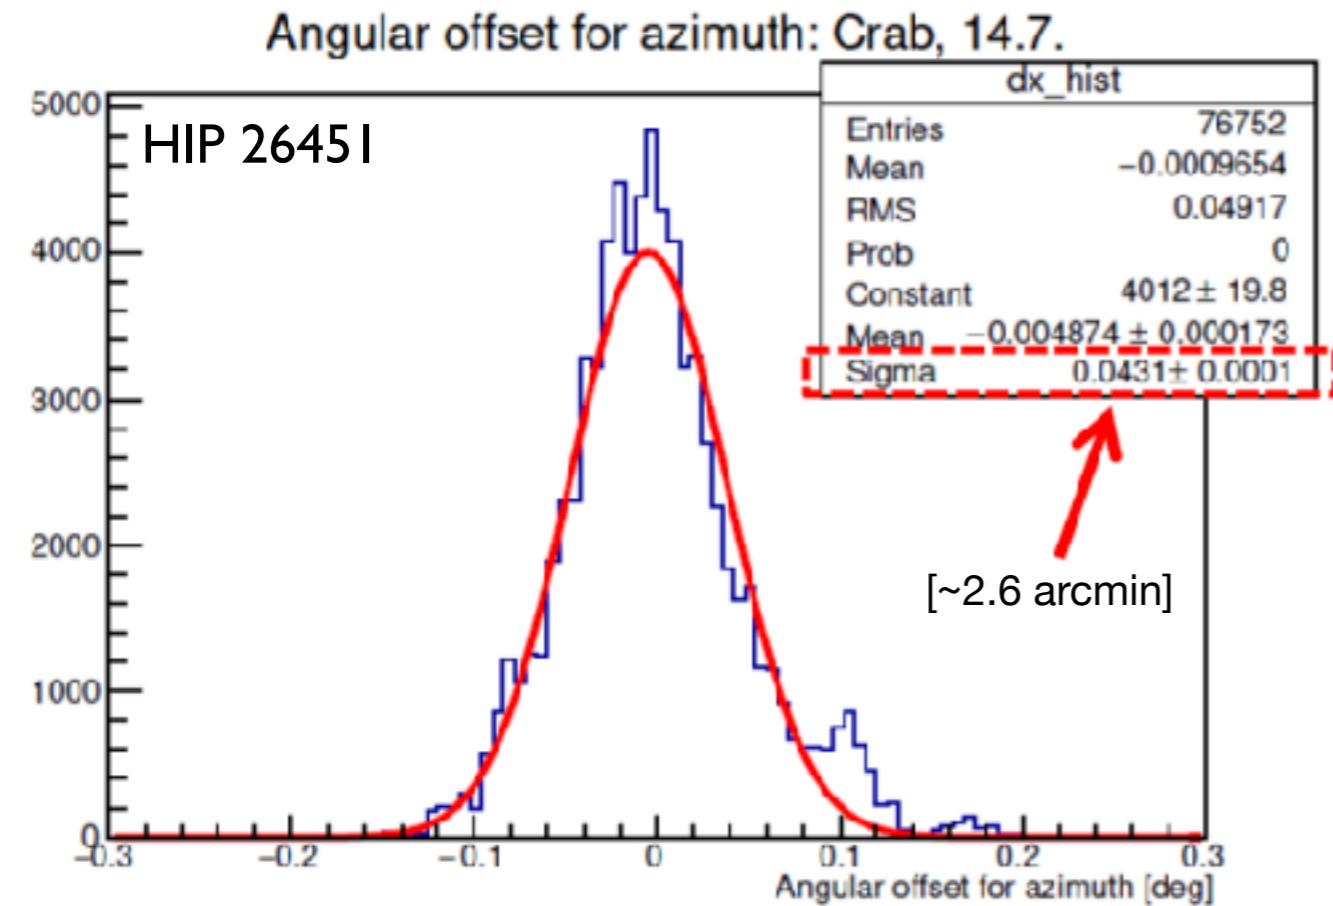

- Pointing strategy: “on-source/off-source”, i.e. to measure background polarisation
- 5° East/West (azimuth) of source, 15 mins period.
- Signal / Background $\sim 1 / 7$
- MDP* $\sim 10\%$

* Unpolarised beam has 1% probability of yielding PF > MDP

- Ballast drops were important!

Polarimeter field-of-view: $\sim 2^\circ$
Pointing requirement: $< 0.1^\circ$ (< 6 arcmin)

Sun tracker performance (Crab observations). Monitor with star camera.

7

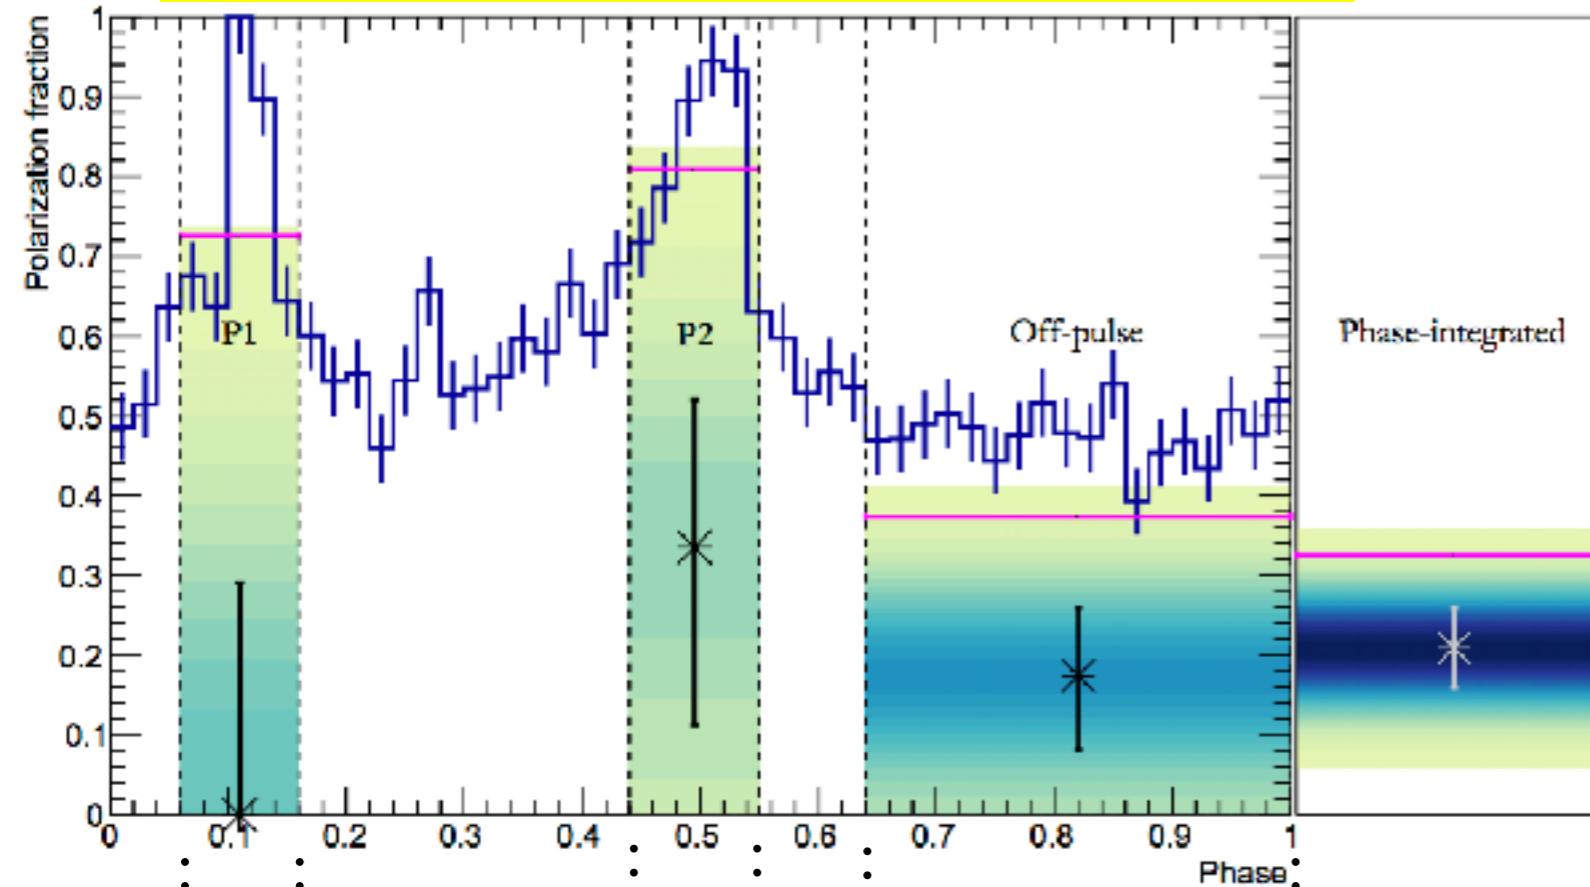

Star tracker performance (Cygnus X-1 observations).

$$\sigma_{Az} = (0.013 \pm 0.002)^\circ \quad [\sim 0.8 \text{ arcmin}]$$

$$\sigma_{El} = (0.003 \pm 0.0003)^\circ \quad [\sim 0.2 \text{ arcmin}]$$

First measurement of polarised emissions from Crab in hard X-ray band (18-160 keV)

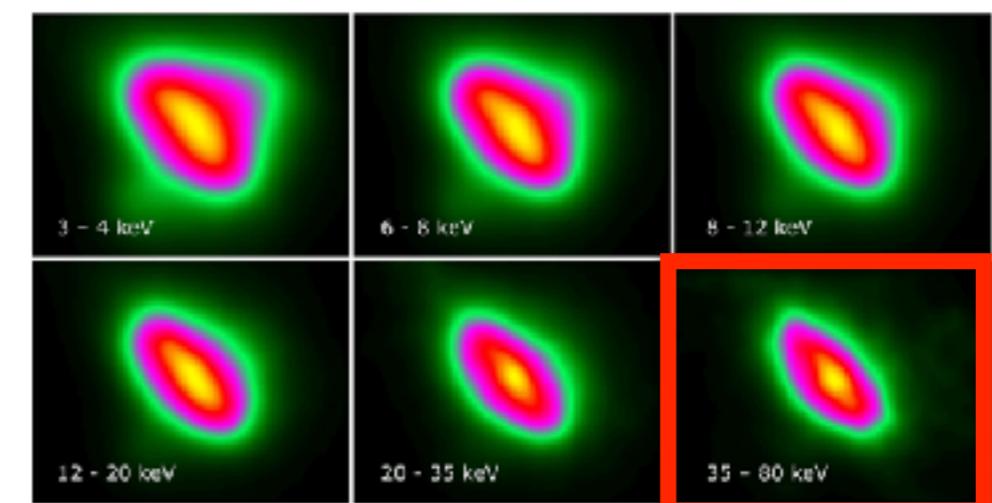

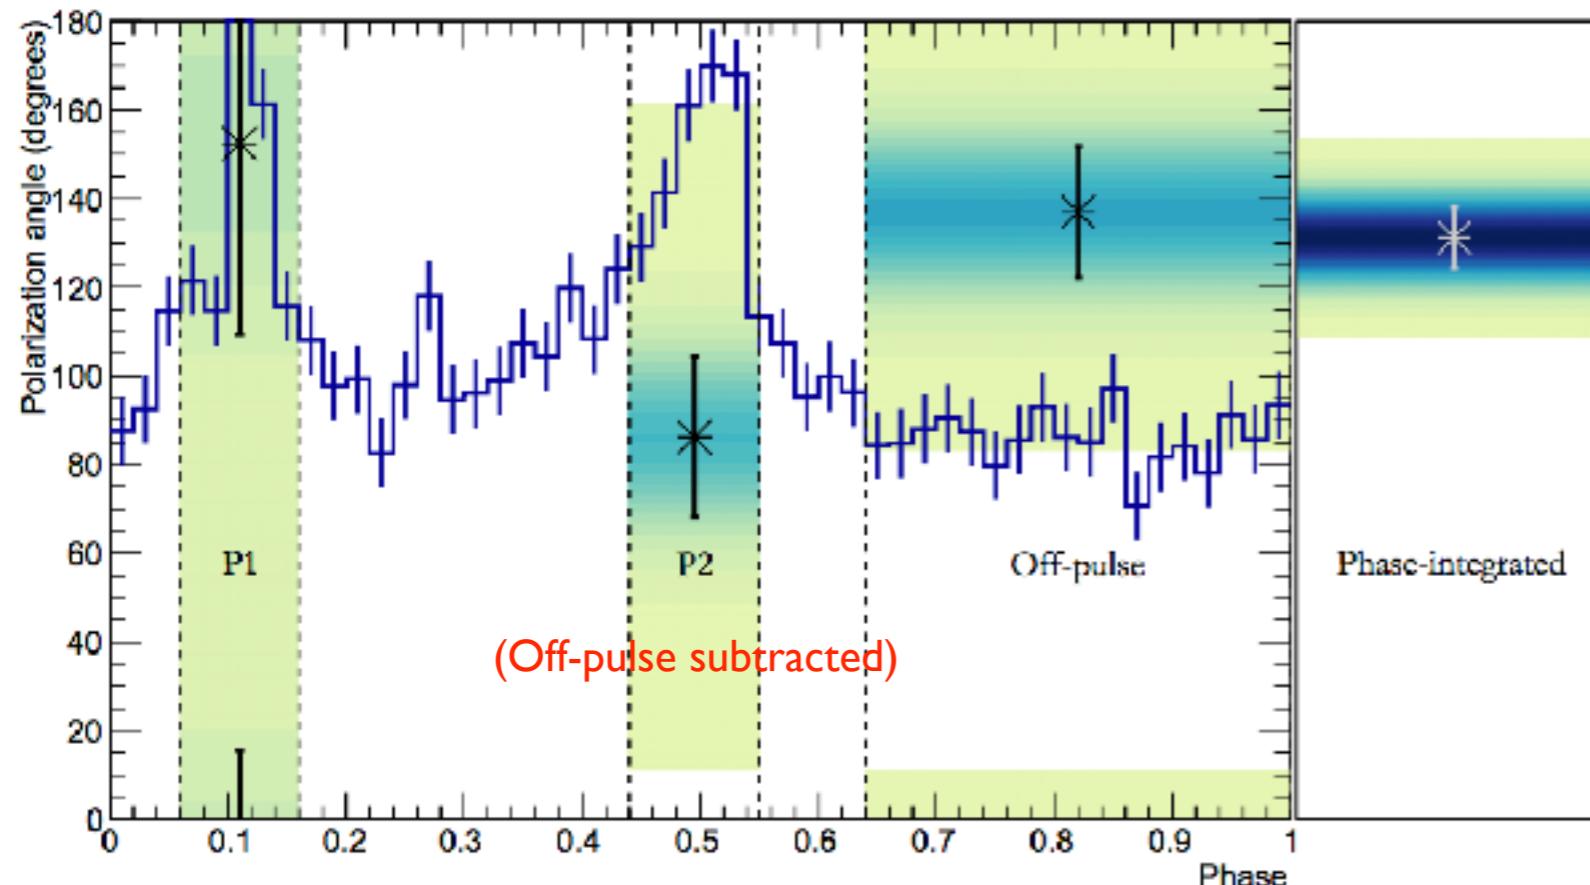

- Phase integrated PF $\sim (21 \pm 5)\%$
 - Purely toroidal magnetic field with isotropic particle distribution $\Rightarrow PF = 37\%$
 - Indicates degree of disorder in emission region
 - Explore further with MHD/PIC simulations

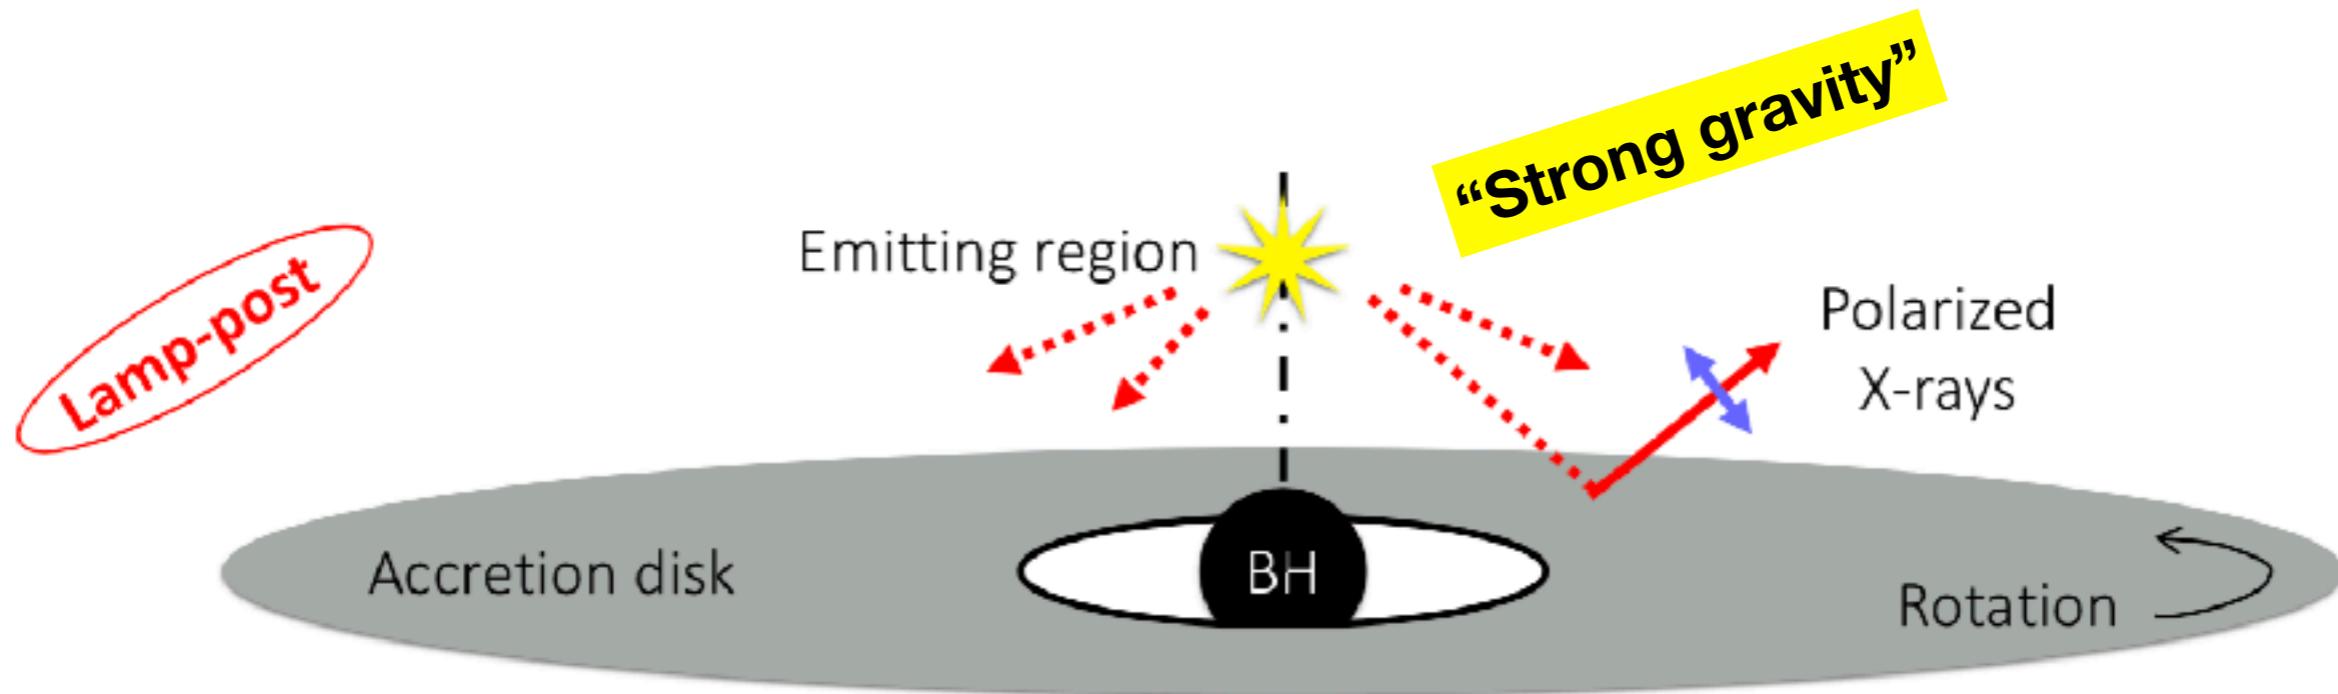

PI ← Pulsar → P2

Nebula

All

Prediction ==> ✓ Polarization fraction: ~15% ✓ Polarization angle: || disk

Prediction ==> ✓ Polarization fraction: few % ✓ Polarization angle: ⊥ disk

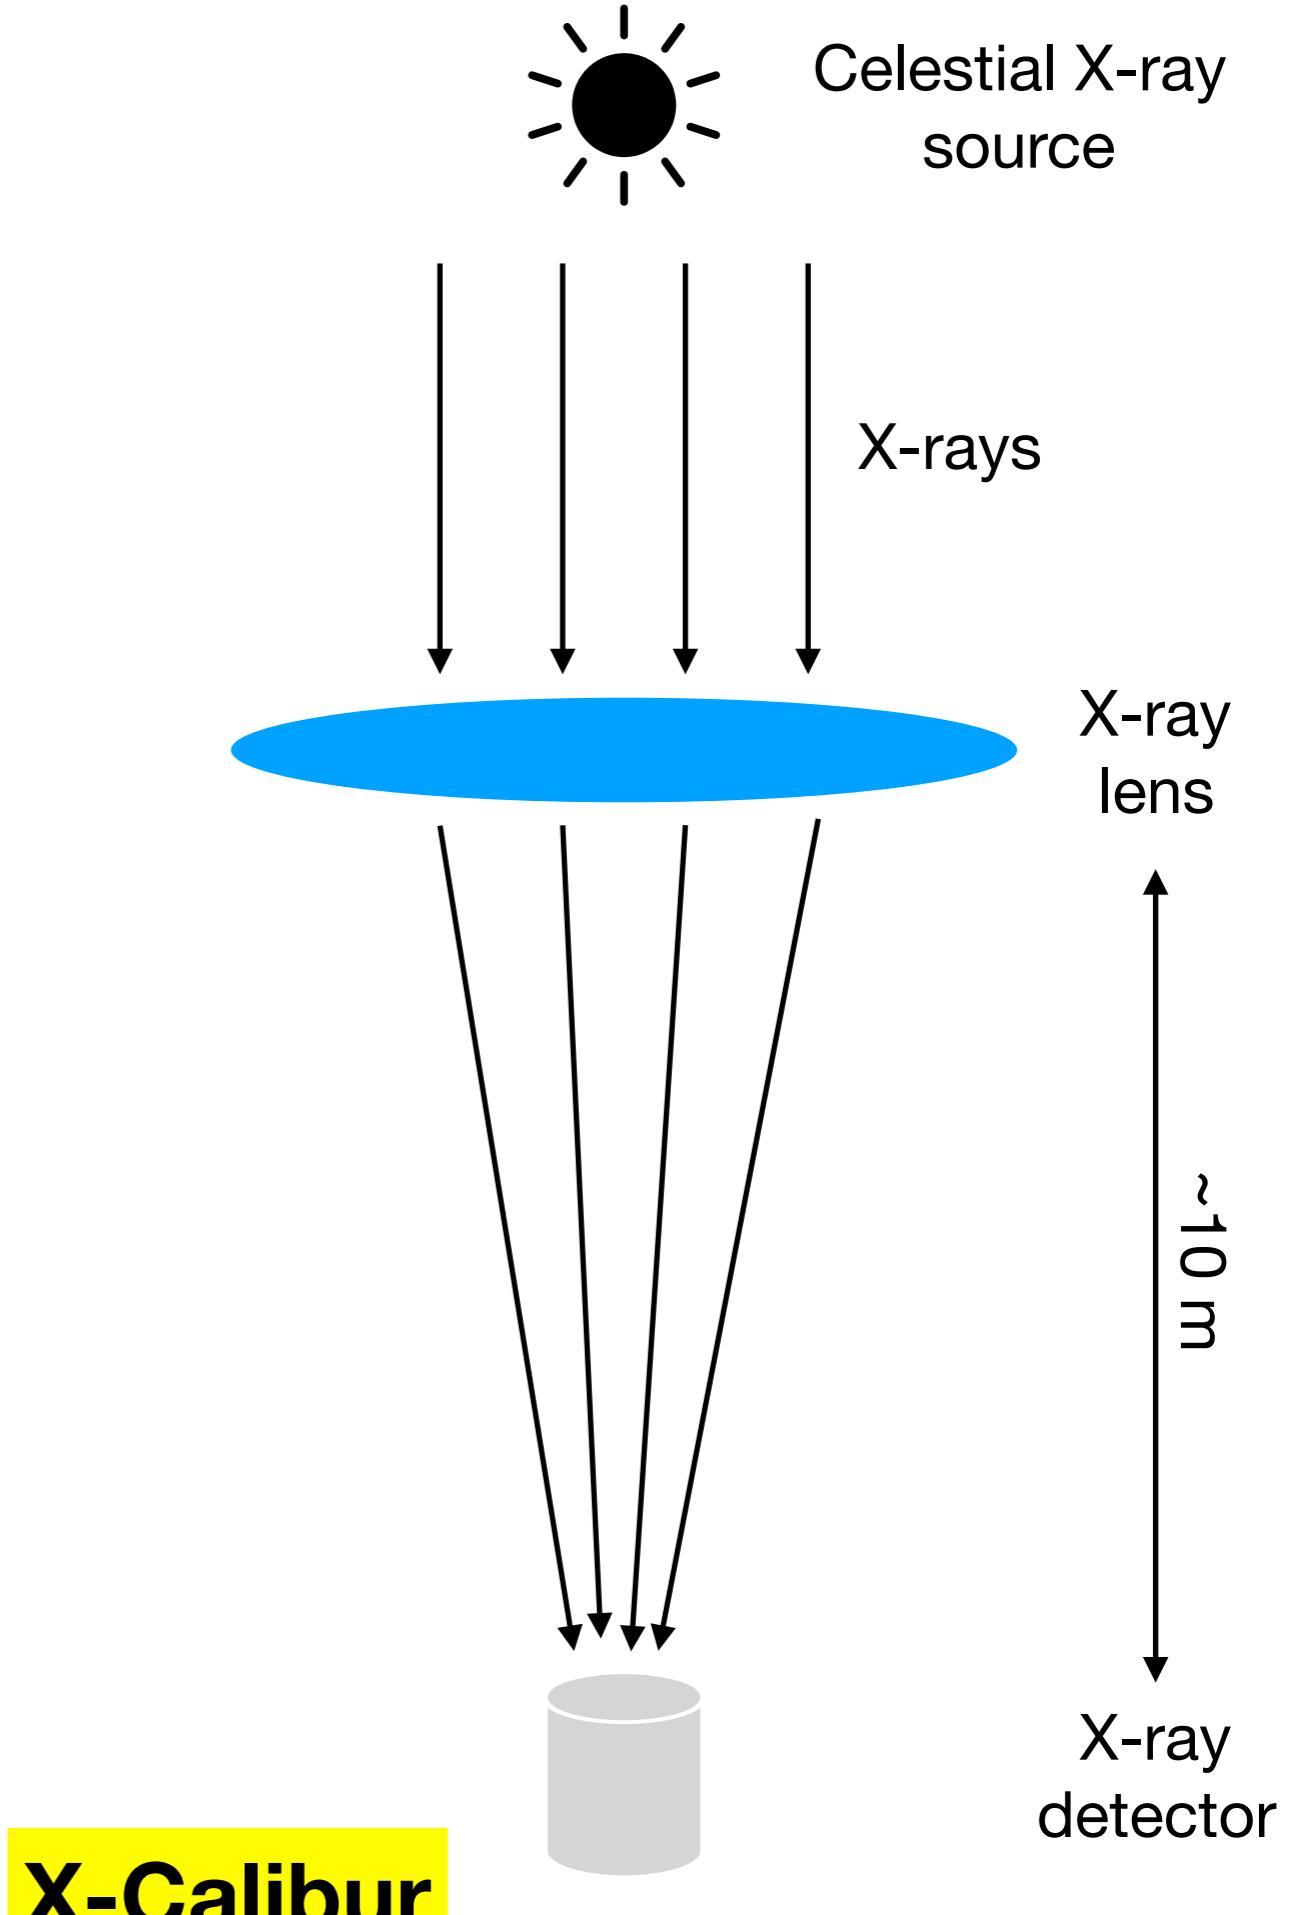

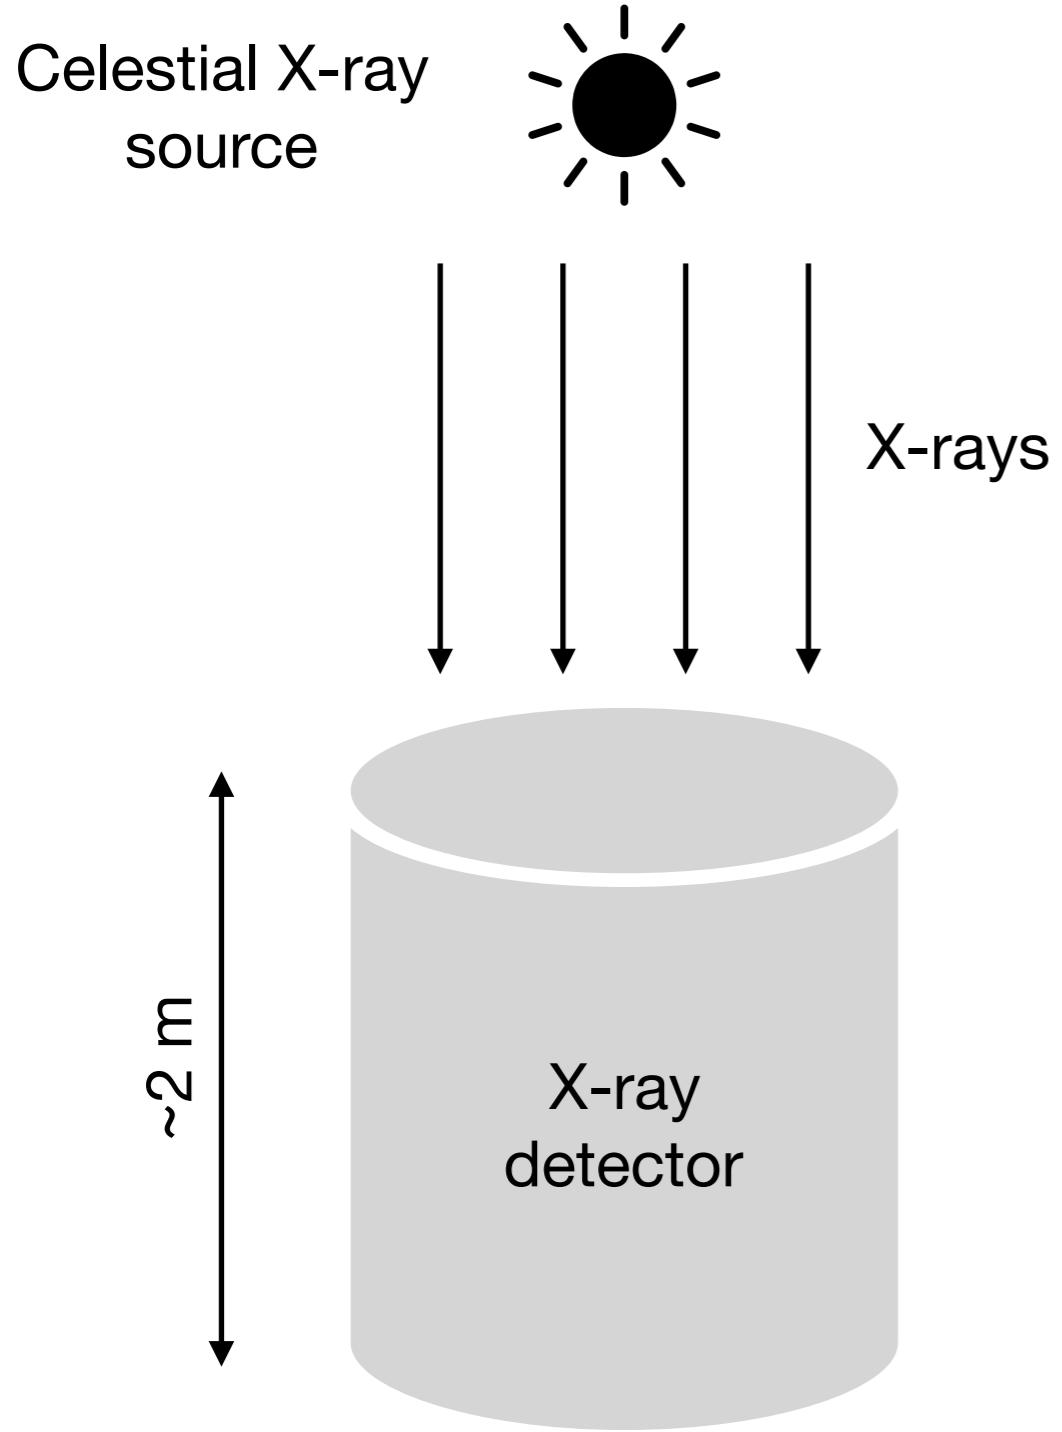

FAQ

Q: Will PoGO+ fly again?

A: No
